2. The state of being expanded; enlargement; distention; dilatation; increase of extent, size, bulk, amount, etc. In the case of the expansion of solids by heat, account is taken of the increase in length or linear expansion, in surface (superficial expansion), and in volume (cubical expansion). The increment in length of the unit for a change of 1° in temperature, or the rate of increase of the unit with the temperature, is called the coefficient of linear expansion; and the coefficients of superficial and cubical expansion, which are respectively two and three times the linear coefficient, are similarly defined. In the case of liquids and gases the expansion in volume is alone considered. The real or absolute expansion of a liquid is the actual increase in volume, while the apparent expansion is that which is observed when a liquid contained in a vessel is heated, and which is less than the real expansion, because of the simultaneous expansion of the vessel itself. It is found that the coefficient of expansion is nearly the same for different gases, and sensibly so for the so-called permanent gases, as hydrogen, oxygen, etc. This coefficient is equal to .003667 for 1° C., or about $\frac{1}{273}$—that is, at 273° C. the volume of a gas expanding under constant pressure is double its volume at 0°; and at −273° C. the volume would be theoretically zero. This last temperature is called the absolute zero.

Spread not into boundless *expansions* either of designs or desires. *Sir T. Browne*, Christ. Mor., i. 19.

Some remarkable examples of *expansion* are furnished by the influence of sunshine on the Britannia Tubular Bridge. *Ure*, Dict., II. 319.

Specifically—3. A part which constitutes an increase or in which the expanding occurs; specifically, in *entom.*, a flat projection of a margin, generally lateral: as, a frontal *expansion* covering the base of the antennæ.—5. Extension or spread of space; extent in general; hence, wide extent; immensity.

> Lost in *expansion*, void and infinite.
> *Sir R. Blackmore*, Creation.

> Venus, all-bounteous queen, whose genial pow'r
> Diffuses beauty, in unbounded store,
> Through seas and fertile plains, and all that lies
> Beneath the starr'd *expansion* of the skies.
> *Beattie*, Lucretius, i.

Distance or space, in its simple abstract conception, to avoid confusion, I call *expansion*, to distinguish it from extension, which by some is used to express this distance only as it is in the solid parts of matter, and so includes or at least intimates the idea of body. . . . I prefer also the word *expansion* to space, because space is often applied to distance of fleeting successive parts, as well as to those which are permanent. *Locke*, Human Understanding, II. xv. 1.

6. In *math.*, the development at length of an expression indicated in a contracted form, especially by means of the distributive principle.

expansion-engine (eks-pan'sho̤n-en″jin), *n.* A steam-engine in which the supply of steam is cut off previous to the completion of the stroke, the expansive power of the steam admitted being sufficient to complete the stroke.—**Triple expansion-engine**, a steam-engine in which steam is expanded in three cylinders in succession, the exhaust from the first driving the piston of the second, and so on.

expansion-gear (eks-pan'sho̤n-gēr), *n.* In a steam-engine, all those parts of the mechanism that control the admission of the live steam from the boiler to the main valve-system and thus to the cylinder. The expansion-gear is intermediate between the actual controlling system of mechanism, which makes the engine automatic, and the steam, controlling the automatic system by independent eccentric systems that may be automatic or may be controlled by the governor or by appliances practically outside the engine. The effect of this supplementary system is to cut off the supply of steam to the slide-valves at any required point of the stroke, for the purpose of using the expansion of the steam already admitted to finish the stroke. This cut-off of the steam may be variable where the expansion admits of it, changing the point of cut-off at will while the engine is at work; it may be fixed or secured at some predetermined point of the stroke; or it may be automatic or self-varying. The most common apparatus includes an expansion-valve moving on the slide-valve and controlled by an eccentric cam on the shaft or by the governor. See *cut-off* and *link-motion*.

expansionist (eks-pan'sho̤n-ist), *n.* One who favors expansion, as of the currency, or the extension of national territory; one who advocates the annexation of outlying territory.

(*b*) An attachment of a boiler in its framing to allow the former to expand without affecting the latter.

expansion-valve (eks-pan'sho̤n-valv), *n.* In a steam-engine, a valve which shuts off the steam in its passage to the slide-valves when the piston has traveled a certain distance in the cylinder, leaving the remaining part of the stroke to be performed by the expansion of the steam. See *expansion-gear*.

2. Capable of being expanded, or of expanding or spreading out in volume or extent; dilatable: as, the *expansive* quality of air; *expansive* gases or substances.—3. Ex-parte hearings, evidence, etc., are often resorted to for temporary relief, or for convenience and expedition, and are not supposed to affect the substantial rights of the absent party. Councils are of two kinds—mutual and ex-parte. A mutual council is one in the calling of which all parties to the difficulty or perplexity concerning which relief is sought unite. An *ex-parte council* is one which is called by one of those parties, after every proper effort to induce all interested to call a mutual council has failed. *H. M. Dexter*, Congregationalism (ed. 1865), p. 64.

In other civilized countries it had previously been conceded, with some specific limitations.

The ill-repute which attaches to considerations of *expediency*, so far as it is well founded, is chiefly due to the fact that, when the question of conduct at issue is one which the person debating it has a private interest in deciding one way or the other — when he himself will gain pleasure or avoid pain by either decision — the admission of *expediency* as the ground of decision is apt to give him an excuse for deciding in his own favour.
T. H. Green, Prolegomena to Ethics, § 330.

Locke, Vind. of Christianity.

Destruction of Troy (E. E. T. S.), l. 3661.

In *entom.,* having the margin flat and dilated, forming an edge: said of the thorax or elytra when the outer sides are so dilated, of the mandibles, etc.

explanation (eks-plạ-nā'shọn), *n.* [= F. *explanation* (rare) = Sp. *explanacion* = Pg. *explanação,* < L. *explanatio(n-),* an explanation, interpretation, < *explanare,* explain: see *explain.*] 1. The act of explaining. (*a*) The act or process of making plain or clear the nature, meaning, or significance of something; the act of rendering intelligible what was before obscure, as by analysis or description; elucidation; interpretation: as, the *explanation* of a passage in Scripture, or of a contract or treaty.

Explanation, then, is analysis, real or ideal, sensible or extra-sensible. It takes the object, or the feeling, to pieces; and is a perfect analysis when the pieces that are obtained can be put together again, and form the original whole. *G. H. Lewes,* Probs. of Life and Mind, II. ii. § 3.

(*b*) The process of showing by reasoning or investigation the causal or logical antecedents or conditions of some thing or event which is to be accounted for; specifically, the making clear by reasoning how certain observed or admitted facts may have been brought about by the action of known principles, if a certain supposition is allowed; the unification of a confused mass of facts, by means of a single known or supposed fact from which they would all necessarily or probably result.

The word *explanation* occurs so continually, and holds so important a place in philosophy, that a little time spent in fixing the meaning of it will be profitably employed. An individual fact is said to be explained, by pointing out its cause, that is, by stating the law or laws of causation, of which its production is an instance. Thus, a conflagration is explained, when it is proved to have arisen from a spark falling into the midst of a heap of combustibles. *J. S. Mill,* Logic, III. xii. § 1.

What is called the *explanation* of a phenomenon by the discovery of its cause, is simply the completion of its description by the disclosure of some intermediate details which had escaped observation.
G. H. Lewes, Aristotle, p. 76.

We suppose the cryptograph to be an English cipher, because, as we say, this explains the observed phenomena that there are about two dozen characters, that one occurs much more frequently than the rest, especially at the ends of words, etc. The *explanation* is: Simple English ciphers have certain peculiarities; this is a simple English cipher: hence, this necessarily has these peculiarities. This *explanation* is present to the mind of the reasoner, too; so much so, that we commonly say that the hypothesis is adopted for the sake of the *explanation*. *C. S. Peirce.*

2. That which is adduced as explaining or seeming to explain; specifically, a meaning or interpretation assigned; the sense given by an expounder or interpreter.

The ill effects that were like to follow on those different *explanations* [of the Trinity] made the bishops move the king to set out injunctions requiring them to see to the repressing of error and heresy with all possible zeal.
Bp. Burnet, Hist. Own Times, an. 1698.

In *rhet.* and *gram.*, a word or syllable which is not necessary to the sense or construction, or to an adequate description of a thing, but which is added for rhetorical, rhythmical, or metrical reasons, or which, being once necessary or significant, has lost notional force. Expletives of the former kind are usually trite adjectives, added, as in feeble prose or verse, for the mere sound or to fill out a line, or else irrelevant words or terms used for factitious emphasis, as in profane swearing. Expletives of the latter kind are usually particles like the introductory *there*, used without local reference, and the auxiliary *do*, used as in the first line of the quotation from Pope.

Expletives their feeble aid do join,
And ten low words oft creep in one dull line.
Pope, Essay on Criticism, l. 346.

Circuitous phrases and needless *expletives* distract the attention and diminish the strength of the impression produced. *H. Spencer*, Style.

To roll and unroll was εἰλεῖν and ἐξειλεῖν, *plicare* and *explicare*; the work unrolled and read to the end was the *liber explicitus*. Hence comes the common *explicit* written at the end of a work; and from the analogy of *incipit liber* in titles, the word was afterward taken for a verb, and appears in such phrases as *explicit liber, explicit, expliceat*, &c.

3. In *alg.*, a symbol placed above and at the right of another symbol (the base), to denote that the latter is to be raised to the power indicated by the former. Thus, $a^2 = aa$, 2 being the exponent. The process symbolized by a negative exponent is the same as taking the reciprocal of the quantity with the positive exponent. Thus, $a^{-2} = \frac{1}{a^2}$. A fractional exponent, the numerator of the fraction being unity, indicates the operation of taking that root of the base which is indicated by the denominator of the exponent: thus, $x^{\frac{1}{2}} = \sqrt{x}$. Exponents are usually understood to follow the associative law $(a^b)^c = a^{(bc)}$, and the distributive law $a^{b+c} = a^b a^c$. But in quaternions and multiple algebra the latter holds only in a modified form. In Hamilton's notation of quaternions, $(a^b)^c = a^{(cb)}$. Exponents were introduced into the notation of algebra by Descartes.

II. *n.* The function expressed by the infinite series $1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 +$, etc., or the Napierian base raised to the power indicated by the variable. Thus, $e^x = \exp. x$ is the *exponential* of x.

extended (eks-ten′ded), *p. a.* **1.** Having extent or extension; occupying space; dimensional; spatial.

We perceive it [body] as something different from our perception, and we perceive it as having something not in our perception; we perceive it, in short, as *extended*.
McCosh, Berkeley, p. 67.

As soon as definite perception begins, the body as an *extended* thing is distinguished from other bodies, and such organic sensations as can be localized at all are localized within it. *J. Ward*, Encyc. Brit., XX. 84.

2. In *her.*, same as *displayed*.

Certain moleculæ seminales must be supposed to make up that defect, and to keep the world and its integrals from an infinitude and *extendlessness* of excursions every moment into new figures and animals.
Sir M. Hale, Orig. of Mankind, p. 10.

extendure† (eks-ten′dūr), *n.* [< *extend* + *-ure*. Cf. *extensure*.] Extent.

extensibility (eks-ten-si-bil′i̤-ti), *n.* [= F. *extensibilité* = Sp. *extensibilidad* = Pg. *extensibilidade*; as *extensible* + *-ity*.] The quality of being extensible: as, the *extensibility* of a fiber or of a plate of metal.

The *extensibility*, and consequently the divisibleness, of gold is probably far more wonderful.

E. D. Cope, Origin of the Fittest, p. 335.

extensible (eks-ten′si-bl), *a.* [< F. *extensible* = Sp. *extensible* = Pg. *extensivel*, < L. as if **extensibilis*, < *extendere*, pp. *extentus*, later *extensus*, extend: see *extend*, *extense*.] **1.** Capable of being extended; admitting of being stretched in length or breadth; susceptible of enlargement or expansion.

The lungs act like a sphygmoscope: they are dilated by internal pressure until their resistance to further dilatation is equal to the dilating force. The less *extensible* they are or become, the sooner will this limit be reached.
A. Daniell, Prin. of Physics, p. 304.

2. In *zoöl.*, capable of being thrust out; extensile; protrusile.

Specifically — (*a*) In *surg.*, the act of pulling the broken part of a limb in a direction from the trunk, in order to bring the ends of the bone into their natural situation. (*b*) In *anat.*: (1) The protrusion of a part away from another part: as, *extension* of the tongue. (2) The straightening of a part, as a limb. (3) The action or function of any extensor muscle, whatever its effect. The continued action of a muscle which straightens a limb may carry a part not only to but beyond a right line, or, if the successive joints of a part be already straight, may bend them. Thus, when the hand is bent back at the wrist, or the end of the thumb is recurved, or the whole trunk of the body is thrown back from the hips, the action or movement is literally *flexion*; but it results from the action of muscles which in most positions of the parts tend to straighten or extend them, and is termed *extension*. See *abduction*, *adduction*, *flection*.

2. The state of being extended; enlargement; expansion; extent.

We entered a large and thick wood of palm-trees, whose greatest *extension* seemed to be south by east.
Bruce, Source of the Nile, I. 52.

3. In *physics* and *metaph.*, continuous quantity of space; also, that property of a body by which it occupies a portion of space.

By this idea of solidity is the *extension* of body distinguished from the *extension* of space: the *extension* of body being nothing but the cohesion or continuity of solid, separable, movable parts; and the *extension* of space the continuity of unsolid, inseparable, and immovable parts. . . . This space, considered barely in length between any two beings, without considering anything else between them, is called distance; if considered in length, breadth, and thickness, I think it may be called capacity. The term *extension* is usually applied to it in what manner soever considered. . . . There are some who would persuade us that body and *extension* are the same thing. . . . If therefore they mean by body and *extension* the same that other people do — viz., by body something that is solid and extended, whose parts are separable and movable different ways, and by *extension* only the space that lies between the extremities of those solid coherent parts, and which is possessed by them — they confound very different ideas with one another. . . . If any one ask me what this space I speak of is, I will tell him when he tells me what his *extension* is. For to say, as is usually done, that *extension* is to have partes extra partes, is to say only that *extension* is *extension*: for what am I the better informed in the nature of *extension* when I am told that *extension* is to have parts that are extended exterior to parts that are extended? . . . To avoid confusion in discourses concerning this matter, it were possibly to be wished that the name *extension* were applied only to matter or the distance of the extremities of particular bodies.
Locke, Human Understanding, II. iv.–xiii.

Doubtless, *Extension* is the fundamental aspect of the objective world as it offers itself to our apprehension. In our everyday view of things, which psychology has to render account of, space has the same appearance of external reality as the body that fills it; and *extension* is the one attribute that is common alike to body and to space.
G. C. Robertson, Mind, XIII. 420.

4. The character of having continuous quantity of any kind, as length of time, weight, etc.

Rate not th' *extension* of the human mind
By the plebeian standard of mankind,
But by the size of those gigantic few
Whom Greece and Rome still offer to our view.
Jenyns, Immortal. of Soul.

5. In *logic*, the totality of subjects of which a logical term is predicable. Logical extension is generally understood to consist of individual objects, but some logicians make it consist of species. The extension is also called the *supposita*, the *subjective parts*, the *external quantity*, the *scope*, the *denotation*, and the *breadth*. (See *breadth*.) It is contrasted with *comprehension* and *intention*. Many logicians say that the greater the extension of a term, the less its comprehension — that is, the more subjects it can be predicated of, the fewer the predicates that can be asserted of it universally. But this statement takes no account of increase of knowledge.

6. A grant of further time in which to do something which has been set down for a particular day. Specifically — (*a*) In *legal proceedings*, a postponement, by agreement of the parties or act of the court, of the time set for service of papers or for other acts. (*b*) In *com.*, a written engagement on the part of a creditor, allowing a debtor further time to pay a debt; more especially, an agreement made between an embarrassed debtor and his creditors, by which the latter agree to wait a fixed time after their claims are due before demanding payment, in order to enable the former to meet his obligations. The agreement is often effected by issuing notes that mature at various times.

7. That by which something is extended or enlarged; particularly (in the United States), an addition to a house, usually at the rear, and not so high as the main building: as, a dining-room *extension*. The term applies whether the extension is part of the original building or is a subsequent addition. — **Difform extension,** the extension of a heterogeneous body, such as a pudding-stone. — **Extension of title,** in *law*, in parts of the United States acquired from Mexico, the certificate of location usually issued by a local commissioner appointed for the purpose, to designate the particular land on which an original grant is to take effect. It is a title of possession, and necessary to perfect the original grant, which does not attach to any specified land. By its issue the grant is said to be extended upon the land designated. — **Uniform extension,** the extension of a homogeneous body, such as a piece of gold.

extensional (eks-ten′sho̤n-a̤l), *a.* [< *extension* + *-al*.] Pertaining to or having extension or extent; existing in space.

You run upon these *extensional* phantasms, which I look upon as contemptuously as upon the quick wrigglings up and down of pismires. *Dr. H. More*, Divine Dialogues.

extension-pedal (eks-ten′sho̤n-ped″a̤l), *n.* In the pianoforte, a pedal for raising the dampers and thus prolonging the tone; the damper-pedal, or loud pedal.

extension-table (eks-ten′shọn-tā′bl), *n.* A table the frame of which is capable of being drawn out in length for the insertion of additional leaves on the top. Such tables are especially used for dining-tables. There are several different mechanical contrivances used in their manufacture.

extensity (eks-ten′si-ti), *n.* [< L. *extensus*, pp. of *extendere*, extend (see *extense*), + *-ity*; after *intensity*.] That kind or element of sensation from which the perception of extension is developed. It is, according to some psychologists, an element in most of our sensations, and is more or less in amount, according to the greater or smaller number of nerve-terminals excited. Other psychologists deny or doubt the existence of any such special feeling.

In a given sensation, more particularly in our organic sensations, we can distinguish three variations: viz., variations of quality, of intensity, and of what Dr. Bain has called massiveness, or, as we will say, *extensity*.
J. Ward, Encyc. Brit., XX. 46.

Extensity is Mr. Ward's name . . . for this primitive quality of sensation, out of which our several perceptions of extension grow. *W. James*, Mind, XII. 183, note.

extensive (eks-ten′siv), *a.* [= F. *extensif* = Pr. *extensiu* = Sp. Pg. *extensivo* = It. *estensivo*, *stensivo*, < LL. *extensivus*, < L. *extensus*, pp. of *extendere*, extend: see *extend*.] 1†. That may be extended or spread out; extensible.

We find a little isle, this life of man.
Cowper, Retirement, l. 147.

3. Pertaining to or characterized by extension in space or in any quantity; having extent or extension.

We do not first experience a succession of touches or of retinal excitations by means of movements, and then, when these impressions are simultaneously presented, regard them as *extensive* because they are associated with or symbolize the original series of movements; but, before and apart from movement altogether, we experience that massiveness or extensity of impressions in which movements enable us to find positions, and also to measure. *J. Ward*, Encyc. Brit., XX. 53.

All our sensations are positively and inexplicably *extensive* wholes. *W. James*, Mind, XII. 536.

4. Pertaining to logical extension.—**Extensive completeness** of a cognition, the perfection of extensive distinctness; thoroughness.—**Extensive distinctness**, the division of the logical extension of a term, in the apprehension of it, into many coördinated marks. Thus, a man who knows all the genera of a zoölogical or botanical family may increase the *extensive distinctness* of his knowledge by learning all the species.—**Extensive energy.** See *energy*.—**Extensive proposition**, in the logic of Sir William Hamilton and his followers, a proposition whose predicate is regarded as a whole under which the subject is contained.—**Extensive quantity.** (*a*) Continuous quantity of space and time.

I call an *extensive quantity* that in which the representation of the whole is rendered possible by the representation of its parts, and therefore necessarily preceded by it. I cannot represent to myself a line, however small it may be, without drawing it in thought.
Kant, Critique of Pure Reason, tr. by Müller.

(*b*) Logical extension.

The external or *extensive quantity* of a concept is determined by the greater or smaller number of classified concepts or realities contained under it. *Sir W. Hamilton.*

extensively (eks-ten′siv-li), *adv.* 1. With regard to extension or extent.

By more complex efforts that are found to procure tactile impressions (continuous or discrete, as the case may be)—efforts not interpretable as movements till they have done their part in the work of psychological construction—we distinguish this and that *extensively* within such body, and the body as a whole in relation to our own bodily frame. *G. C. Robertson*, Mind, XIII. 423.

2. In an extensive manner; widely; largely; to a great extent: as, a story *extensively* circulated.

'Tis impossible for any to pass a right judgement concerning them, without entering into most of these circumstances, and surveying them *extensively*.
Watts, Improvement of Mind.

Like boys who are throwing the sun's rays into the eyes of a mob by means of a mirror, you must shift your lights and vibrate your reflexions at every possible angle, if you would agitate the popular mind *extensively*.
De Quincey, Style, i.

3. Same as *extensity*. [Rare.]

Extensiveness, being an entirely peculiar kind of feeling, indescribable except in terms of itself, and inseparable in actual experience from some sensational quality which it must accompany, can itself receive no other name than that of sensational element. *W. James*, Mind, XII. 2.

extensometer (eks-ten-som′e-tėr), *n.* [Irreg. < L. *extensus*, pp. of *extendere*, extend, + *metrum*, a measure.] An apparatus for measuring minute degrees of expansion or contraction in metal bars under the influence of temperature or under strain. See *expansion*.

exterior (eks-tē′ri-ọr), *a.* and *n.* [Early mod. E. also *exteriour*; < OF. **exteriour*, later *exterieur*, F. *extérieur* = Pr. Sp. Pg. *exterior* = It. *esteriore*, < L. *exterior*, outward, outer, compar. of *exter* or *exterus*, outward, on the outside, foreign, < *ex*, out, + *-ter*, *-terus*, compar. suffix. Cf. *interior*. The corresponding L. superl. is *extremus*: see *extreme*.] I. *a.* 1. Situated or being outside; pertaining to or connected with that which is outside; outward; outlying; external: as, the *exterior* relations or possessions of a country; an *exterior* boundary or line of fortification. In mathematics applied to a position with reference to a surface in space such that from that position it would be possible to proceed by a continuous motion to infinity without crossing the surface. In like manner, on a surface a position is exterior to a contour if from that position it would be possible to move to the limit of the surface, or to infinity, without crossing the contour. Also, if a space, a surface, or a line be divided into three parts in such a manner that from the first it would not be possible to pass to the third without traversing the second, the first and third are said to be exterior to the second. Upon a closed surface, or curve, the term *exterior* can have only a modified meaning: the larger part is generally regarded as the exterior. When two lines are crossed by a third line eight angles are formed, and of these those that are outside of the space between the first two are termed *exterior*, although if another pair of the three lines is considered as the first pair other angles will be exterior.

2. Related to or connected with the outside; acting or originating from without; outwardly manifested or perceived; not intrinsic.

3. In *optics*, the arresting of a beam of light by polarization, by the imperfect transparency of the medium, or otherwise. Thus, extinction takes place when the vibration-planes of the two Nicol prisms in a polariscope are set at right angles to each other (see *polarization*), for then the light which passes through the first, or polarizer, is arrested or extinguished by the second, or analyzer. The extinction-directions in a section of a transparent doubly refracting substance are the principal planes of light-vibration; for if the section is placed between the crossed nicols, it remains dark only when these directions coincide with the vibration-planes of the nicols. If these directions coincide with the crystallographic axes, the extinction is said to be *parallel*, otherwise it is *oblique*. See *ocular*, etc., *ophthalmia*, etc., *optic*, etc.] **1.** The organ of vision; the physiological mechanism of the sense of sight; an anatomical arrangement of parts by which optical images may be formed; in general, any part of an animal body by means of which the faculty of vision is exercised, or the impact of the light-rays is sensed as a visual impression or optical image. In most of the higher animals, as nearly all vertebrates, the eye is developed as a very special sense-organ of great structural complexity and functional delicacy. But from the point of view of comparative anatomy an eye is any part of an animal body which responds more readily than other parts to the special stimulus of light, or whose activity is specially excited by the impact of light-rays. Thus, an extremely rude eye in the form of a mere spot, often a pigment-spot sensitive to light, is common in low animals, as in infusorians, and may be situated anywhere on the body, and may be indefinitely multiplied in number. These rudiments of eyes are commonly described as *eye-specks*, *eye-points*, or *eye-spots.* (See cut under *Balanoglossus.*) In various cœlenterates and echinoderms organs apparently responsive to the action of light occur in various parts of the body and in varying numbers. Somewhat higher in the scale of evolution, eyes become unmistakable in structural character, however dim or uncertain their actual visual function may be, as in worms, snails, etc. But in some of the *Mollusca*, as cuttlefishes, eyes are highly specialized as visual organs of conspicuous character, comparable to those of vertebrates, though constructed on a different plan. In the vast assemblage of arthropods, as crustaceans, insects proper, and arachnidans, constituting a large majority of the animal kingdom, eyes as a rule are well developed under one or both of two main modifications, namely, the *simple eye* or *ocellus* and the *compound eye* or *oculus.* (See *compound eye*, below, and cut under *Calx.*) Such eyes are usually only two, but may be four, six, or eight in number. These higher numbers of eyes occur chiefly in arachnidans, as spiders. Crustaceans have normally a single pair, often mounted on movable eye-stalks or ophthalmites, which are modified limbs of one of the cephalic segments. (See cut under *stalk-eyed.*) A few crustaceans have a single median eye. In vertebrates, where the eyes are normally never more nor fewer than one pair, these organs are received in special formations of the skull, the *sockets* or *orbits* of the eyes; and the eyes are usually further defended from accidental injury by various contrivances, as *eyelids*, *eyelashes*, and *eyebrows.* (See these words.) Other appendages of the eye namable among its "defenses" are the lacrymal apparatus, which secretes tears to moisten the organ, and the glandular structures (Meibomian follicles), which serve for its lubrication by secreting a greasy substance. The front of the eye has usually a special mucous membrane, the *conjunctiva.* The most essential or intimate parts of the organ of vision are contained in a globe or disk, the *eyeball* (which see), which is freely movable in its socket in the higher vertebrates, and rolled about by the action of various muscles, as the four recti and two obliqui of man and the choanoid muscle of some mammals. Externally the eyeball consists for the most part of a tough opaque membrane, the *sclerotic*; but in front, of a hard transparent structure, the *cornea.* These together are the outermost of three *tunics* or *coats* of the eye; the second tunic consists of the *choroid coat* and *ciliary processes* and the *iris*, and the third and innermost of the *retina*, the expanded end of the *optic nerve*, which enters the ball from behind and spreads out upon the choroid to a varying extent. The retina receives optical impressions focused upon it by the crystalline lens, which are transmitted by the optic nerve to the brain, where they are sensed as visual images. The hollow eyeball with its several tunics forms a kind of camera filled with certain solid and fluid refractive media. Directly in the axis of vision in the interior of the ball is suspended a solid biconvex body, the *crystalline lens*, serving to bring rays of light to a focus on the retina. The lens, inclosed in its capsule, also divides the interior of the eye into two compartments. The larger rear compartment is filled with a glassy fluid, the *vitreous humor*, inclosed in a delicate hyaloid membrane, which may also send prolongations through its substance. In front of the lens, between this structure and the cornea, the space is filled with a more watery fluid, the *aqueous humor.* This anterior space is partly divided into an anterior and a posterior chamber by the iris, which hangs in front of the lens like a curtain with a hole in the middle, the *pupil.* Besides the optic nerve, or special nerve of sight, the eye is supplied with other motor, sensory, and sympathetic nerves, and has its appropriate blood-vessels. In man both eyes look directly forward, their axes being parallel, though the orbits in which they are contained present a little outward, or away from each other. The optic nerve follows the axis of the orbit, and consequently pierces the eyeball behind, a little on the inner side—that is, toward the nose. The muscles which move the ball are six, the rectus superior, rectus inferior, rectus externus, rectus internus, obliquus superior, and obliquus inferior. These muscles are innervated by three motor nerves, the oculomotor, trochlear or pathetic (distributed to the obliquus superior), and abducent (distributed to the rectus externus). The ball is embedded in a quantity of adipose tissue forming a soft cushion, but is also somewhat isolated by means of a thin membranous sac called the *vaginal tunic* or sheath of the eye. The ball is nearly spherical or globular, but is a little deeper and wider across than from before backward, measuring about an inch in each of the former axes and $\frac{9}{10}$ of an inch in the latter. (For the structure of the several tunics, see *sclerotic*, *cornea*, *choroid*, *ciliary*, *iris*, and *retina.*) The retina is an expansion of the optic nerve into a large, circular, concavo-convex sheet, which rests upon the choroid with its inner surface in contact with the body of vitreous humor in the back of the eye. In the middle of it and in the axis of the eye is a little rounded elevation, the *yellow spot*, or *macula lutea*, with a depression at its summit, the *fovea centralis.* To the nasal side of the yellow spot is the entrance of the optic nerve and of the central retinal artery; and here the retina lacks the visual function which characterizes all the rest of its surface. The lens is suspended in a transparent capsule in the axis of vision; it is biconvex, and more convex on its posterior than on its anterior surface. It is about $\frac{1}{3}$ of an inch across and $\frac{1}{4}$ of an inch deep, and its structure presents concentric laminations. It tends to flatten with age. (See *crystalline lens*, under *crystalline.*) The vitreous humor fills the hollow of the eyeball behind the lens. It is a glassy or jelly-like substance, consisting chiefly of water, with a little saline and albuminous material, inclosed in a delicate hyaloid membrane continuous in front with the capsule and suspensory ligament of the lens, and behind resting upon the retina. Some prolongations of the hyaloid enter the substance of this humor, and one of these is called the *canal of Stilling.* The quantity of vitreous humor, or bulk of the vitreous body, is about $\frac{4}{5}$ of the entire mass of the eyeball. The aqueous humor is the slightly saline watery fluid which fills the eye in front of the lens, between this and the cornea, on both sides of the iris, consequently occupying the whole of the anterior and posterior chambers of the eye. Its bulk is very small. (See *conjunctiva*, *lacrymal*, *Meibomian*, *nasal*, *ocular*, *ophthalmic*, *optic*, *palpebral*, *superciliary*, *tarsal*, etc.) The eye agrees with other sense-organs in development in the embryo, in being partly formed by the inversion or involution of a portion of epiblast from without, and partly by protrusion or evolution from within of a primitive ocular vesicle, the two coming together in the situation where the lens is to be developed. The result is that a portion of epiblast from the back of the embryo, which had been shut into the hollow of the cerebrospinal tube, pushes out from one of the cerebral vesicles to meet another portion of epiblast from the face of the embryo. Thus, the retina and associate parts are an outgrowth from the undeveloped brain, while the lens and associate epithelial structures are an ingrowth of epidermis. In other mammals with well-formed eyes the structure is substantially the same as in man, though minor and incidental variations are numerous. The eyes of quadrupeds usually present laterally, and not directly forward. They are usually relatively larger and probably much more effective organs of vision than those of man. They frequently develop a special choanoid muscle or retractor of the eyeball. The iris is commonly black, brown, or of some dark tint, seldom bluish or pale. It often contracts in such a way that the pupil is linear, elliptical, or narrowly oval, instead of circular, as in man. This is well seen in the cat. In birds several modifications occur. The eyeball is strengthened and its shape molded by a set of splint-bones or small bony plates disposed in a circle in the sclerotic around the cornea. The ball is hemispherical with an anterior projection, somewhat like a short acorn in a large cup, and the cornea is very convex. The pupil is always circular, though the iris may be so motile as to present only a narrow ring round the pupil, or to reduce the pupil to a mere point. These changes are well seen in the eyes of owls. There is also in the vitreous humor a peculiar plaiting or folding of the choroid, called the *marsupium* or *pecten.* The visual range and power of the eye in some birds, if not in all, are much greater than in man. All birds have three eyelids, the third very fully developed and arranged so as to sweep entirely across the front of the eye by means of special muscles and tendons upon the back of the eyeball. No birds are eyeless. In reptiles the eyes are structurally more like those of birds than of mammals. Some reptiles are eyeless, or have very rudimentary eyes. Most have eyelids, but these are wanting in ophidians, a transparent cuticle being continued directly over the ball, and shed with the rest of the cuticle. In fishes the eyes are generally symmetrically lateral, but not infrequently dorsal and closely approximated to each other, and rarely inferior; in one type, the heterosomes or flat-fishes, they are, however, both on one side, that belonging to the side which rests on the ground being in the very young in the normal position, but soon actually penetrating through the integument, and with the circumocular cranial region twisting to the opposite side and assuming a permanent position above the regular eye of the colored or uppermost side. The accessories of the eyes of mammals are undeveloped in fishes, but the eyes themselves are sometimes covered by a fold of the integument, and sometimes, as in some sharks, by a peculiar nictitant membrane. Among the most characteristic features are the flattening of the cornea and the sphericity of the crystalline lens. In one group (*Anableps*) a remarkable deviation from all other forms occurs, in that the cornea is divided by a horizontal band of the conjunctiva into upper and lower halves, and two pupils are developed, the species consequently being known as four-eyed fishes. In the lowest of the vertebrates (*Branchiostoma*) the eye is represented by a very small spot, coated with dark pigment and receiving the end of a short nerve. See *vision.*

In the case of the higher crustaceans they are more fully called *crab's eyes*. (See *crab*^{1}.) In the crawfish they are two discoidal plates in the middle of the lateral surface of the walls of the anterior dilated portion of the cardiac division of the stomach, and weigh about two grains. They begin as calcareous deposits underneath the chitinous gastric lining, and increase until the creature molts, when they are also shed, together with the lining membrane and gastric armature.—**A** or **the green eye**, jealousy: from the poetic description of jealousy as the green-eyed monster.—**All my eye**, or **all in one's eye**, entirely in the eye or mind; seeming; apparent, but not real. Apple of the eye. See *apple*.—**Artificial eye**, an object made in imitation of the natural eye. Those used for anatomical purposes are constructed of wax or papier maché. For use as substitutes for lost human eyes they are made of glass or porcelain. The chief use of artificial eyes, however, is for filling the sockets of stuffed animals. The simplest are small black glass beads or buttons mounted on a bit of fine wire. Larger eyes are more elaborately made of various shapes, with a close imitation in color of the iris or shape of the pupil.—**At eye†**, at a glance.

Chambers of the eye. See *chamber*.—**Compound eyes**, in insects, simple eyes or ocelli set so close together that their several corneas are in contact, and pressed into tetragonal or hexagonal figures with slightly convex surfaces, giving the eye a faceted appearance, whence the name *faceted eyes*. Each cornea then answers to one of the faces of a cut brilliant. Behind such a cornea, instead of a lens, is placed a transparent pyramid whose base corresponds to the cornea, and whose apex is directed inward to be received into a kind of transparent calyx answering to a vitreous body. This last is surrounded by another calyx formed by the expansion of a nerve-filament arising from a ganglion on the end of the optic nerve, a short distance from the brain. Each lens-like pyramid, with its vitreous body and nerve-filament, is surrounded by a choroid coat, usually of a brown color. The size and shape of compound eyes, and especially the number of their facets, are very variable. Different facets of the same eye also vary in size.—**Crab's eye.** See def. 12.—**Dorsal eyes.** See *dorsal*.—**Evil eye.** See *evil*^{1}.—**Eye-and-ear observation**, in *astron.*, an observation of the time of passage of a star across a wire, made in the following way: The observer, having his eye at the telescope, listens to the beats of a clock, and notes where the star is at the beat immediately preceding the passage, and where it is at the next following beat. He mentally divides the space run over in this second into tenths, and by estimating in what part of it the wire lies, he determines the time of the passage to a tenth of a second.

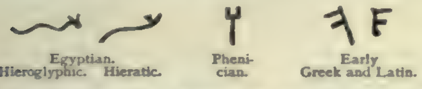
(See cut under *skull*.) The projection, however, is slight in comparison with the beetling superorbital ridges of many animals, as the gorilla. In birds, and in many reptiles and fishes, the eyebrow is a separate formation of a bone, or chain of bones, along the upper edge of the orbit, whose nature is that of the lacrymal bone. These are known as superorbitals, or superorbital bones or ossicles. (See cut under *Lepidosiren*.) It seems that in the earlier periods, when these justices were empowered to levy royal revenues, remonstrances of the people led to a concession that they should make the circuit only once in seven years. F 1. The sixth letter and fourth consonant in the English alphabet, as in the Latin and the Phenician, and also as in the early Greek alphabet, through which the Latin was derived from the Phenician (see *A*), although it has gone out of use in the alphabet generally known to us as Greek. The Phenician character had the name *vav* or *waw* (meaning 'peg' or 'hook'), and its value was that of our English *w*. This same value it had in primitive Greek use, and it is found so used in western inscriptions, although lost too early to appear in eastern inscriptions. The sound, namely *w*, went gradually out of use in Greek, and its sign went with it. Since the latter somewhat resembled in form one gamma (Γ) written above another, the Greek grammarians gave it the fanciful name of *digamma* or *double gamma*, by which therefore we generally call it as a Greek letter. The comparative scheme of forms (compare *A*) is as follows:



In the adaptation of the alphabet to Latin use the sign first received the value we give it, since the *f*-sound occurred in Latin and needed a representative; the *w*-sound was provided for by being written with the same character as *u*. (See *U* and *V*.) The sound *f*, as we pronounce it, is a surd (or breathed, or voiceless) labiodental, a fricative sound or spirant: that is to say, it is made by the audible friction or rustling of the unintonated breath, when forced out between the edge of the lower lip and the tips of the upper teeth, these being held in contact with one another. If, everything else remaining the same, the intonated breath be forced out instead, the sound is *v* (as in *valve*, *vivid*); hence *f* and *v* are corresponding surd and sonant. An *f*, nearly identical with ours in audible character, may also be made between the edges of the two lips alone, without any help from the teeth; and such a purely labial *f* is heard in many languages, and is with probability to be regarded as more primitive than the labiodental *f*, and as forming the transition to it, in the languages where the latter prevails. The same sound is also widely represented in English by *ph*, but almost only in words coming from the Greek; it also exists in some words written with *gh*, as *laugh*, *cough*, *clough*, *rough*, *tough*, etc., the labial aspirant having taken in such words the place of the palatal, such change being recognized in the spelling in only a few words, as *dwarf*, *draft* (= *draught*), *duff* (= *dough*, as formerly pronounced), etc. Historically, *f* stands in general for a more original *p*, as found in Sanskrit and the classical languages: thus, *father* for *pitar*, πατήρ, *pater*, etc.

> Thus the letter *F* is derived from the Hieroglyphic picture of the cerastes, or horned Egyptian asp.
> *Isaac Taylor*, The Alphabet, I. 12.

2. A real state of things, as distinguished from a statement or belief; that in the real world agreement or disagreement with which makes a proposition true or false; a real inherence of an attribute in a substance, corresponding to the relation between the predicate and the subject of a proposition. By a few writers things in the concrete and the universe in its entirety are spoken of as *facts*; but according to the almost universal acceptation, a *fact* is not the whole concrete reality in any case, but an abstract element of the reality. Thus, Julius Cæsar is not called a *fact*; but that Julius Cæsar invaded Britain is said to have been a *fact*, or to be a *fact*. To this extent, the use of the word *fact* implies the reality of abstractions.

With the majority of writers, also, a *fact*, or *single fact*, relates only to an individual thing or individual set of things. Thus, that Brutus killed Cæsar is said to have been a *fact*; but that all men are mortal is not called a *fact*, but a *collection of facts*. By *fact* is also often meant a true statement, a truth, or truth in general; but this seems to be a mere inexactness of language, and in many passages any attempt to distinguish between the meanings on the supposition that *fact* means a true statement, and on the supposition that it means the real relation signified by a true statement would be empty subtlety. *Fact* is often used as correlative to *theory*, to denote that which is certain or well settled—the phenomena which the theory colligates and harmonizes. *Fact*, as being special, is sometimes opposed to *truth*, as being universal; and in such cases there is an implication that *facts* are minute matters ascertained by research, and often inferior in their importance for the formation of general opinions, or for the general description of phenomena, to other matters which are of familiar experience.

I am wounded
In *fact*, nor can words cure it.
Fletcher (and another), Elder Brother, iv. 1.

The Right Honorable gentleman is indebted to his memory for his jests and to his imagination for his *facts*.
Sheridan, Speech in Reply to Mr. Dundas.

In order to believe that gold is yellow, I must, indeed, have the idea of gold, and the idea of yellow, and something having reference to these ideas must take place in my mind; but my belief has not reference to the ideas, it has reference to the things. What I believe is a *fact* relating to the outward thing, gold, and to the impressions made by that outward thing upon the human organs; not a *fact* relating to my conception of gold, which would be a *fact* in my mental history, not a *fact* of external nature.
J. S. Mill, Logic, I. v. § 1.

The basis of all scientific explanation consists in assimilating a *fact* to some other *fact* or *facts*.
A. Bain, Logic, III. xii. § 2.

The whole human *fact* of him, as a creature like myself, with hair and blood and seeing eyes, haunted me in that sunny, solitary place, not like a spectre, but like some friend whom I had basely injured.
R. L. Stevenson, Merry Men.

3. In *law*, an actual or alleged physical or mental event or existence, as distinguished from a legal effect or consequence: as in the phrases *matter of fact*, *question of fact*, *the facts of the case*, as distinguished from *matter of law*, *question of law*, *the law of the case*. Thus, whether certain words were spoken is a question of *fact*; whether, if spoken, they constituted a binding promise, is usually a question of *law*. **Ablative fact**, a fact which according to law takes away a right.—**Collateral facts.** See *collateral*.—**Collative fact**, a fact appointed by law to give commencement to a right.—**Conclusion of fact.** See *conclusion*.—**Divestitive fact.** Same as *ablative fact*.—**Error in fact.** See *error*.—**Evidential** or **evidentiary facts.** See *evidential*.—**Fact of consciousness**, a fact whose existence is given and guaranteed by an original and necessary belief.—**Fixed fact.** See *fixed*.—**In fact**, in reality; in truth; indeed.

3. In *Rom. antiq.*, one of the classes into which the charioteers in the circensian games were divided, one of each contending in a race. The four regular factions, distinguished by their dresses as the green, red, blue, and white, represented spring, summer, autumn, and winter. Domitian added purple and yellow factions, making six contestants in every race; but these new divisions were not permanent. A dispute in Constantinople, in 532, between the green and blue factions and their partizans, the emperor Justinian favoring the latter, led to a civil war of five days, which cost 30,000 lives and nearly overthrew the government.

Their trains must bate,
Their titles, feasts, and *factions*.
B. Jonson, Sejanus, ii. 2.

For instance, in certain branches of this stock, as the Persian, etc., . . . the tendency of causal verbs to lose their force altogether, even with the longer *factitive* form, which they faithfully keep, is only the breaking through of that principle which asserted itself almost universally in the late analytic state of the group.

=**Syn.** **2.** *Fairy, Elf, Fay; Sylph, Gnome; Jinn, Genie; Goblin.* *Fairy* is the most general name for a diminutive imaginary being, generally in human form, sometimes very benevolent or inclined to teach moral lessons, as the *fairy* godmother of Cinderella; sometimes malevolent in the extreme, as in many fairy stories. Spenser took up the word in Chaucer's spelling, *faerie* or *faery*, and gave it an extended meaning, which is now commonly confined to that spelling and to his poem; the personages in "The *Faery* Queene" live in an unlocated region, essentially like the rest of the world, and are of heroic and occasionally supernatural powers; these personages he sometimes calls *elves* or *elfins*. In ordinary use an *elf* differs from a *fairy* only in generally seeming young, and being more often mischievous. Pope, in "The Rape of the Lock," has given a definite cast to *sylph* and *gnome;* these two words are elsewhere often associated, *gnomes* having always been fabled as living in underground abodes, and especially as being the guardians of mines and quarries, while *sylphs* are denizens of the air. From this difference of place it has followed that *gnomes* are generally thought of with repugnance or dread, and *sylphs*, although of both sexes in literature, are popularly thought of as young, slender, and graceful females: hence the expression "a *sylph*-like form." To Oriental imagination is due the *jinn, djinn,* or *jinnee;* the form *genie* is most vividly associated with the "Arabian Nights": as, the *genie* of Aladdin's lamp; the *genie* that the fisherman let out of the bottle. A *goblin* is wicked, mischievous, or at least roguish, and frightful or grotesque in appearance. See the definitions of *kobold, sylph, brownie, banshee, sprite, pixie, nixie, nymph,* etc.

The birds used in hawking belong to one of two groups: (*a*) Falcons proper in an ornithological sense (see def. 2 (*c*)), belonging to the restricted genus *Falco*, of which the peregrine is the type. These birds rise above the quarry and stoop to it by dashing down from on high; they are most highly esteemed for hawking, and called *noble*. They capture the quarry by direct chase after it, and are called *ignoble*—a term somewhat loosely extended to other birds of prey which cannot be trained to the chase at all. In heraldry the falcon is generally represented with bells on the legs, but it is necessary to mention in the blazon the bells and their tincture. It is always supposed to be *close* unless the attitude is mentioned in the blazon. Where the falcon is described as *jessed and belled*, the jesses are represented as hanging loose.

But the word *paralogism* is also used to signify a purely logical fallacy—that is, a *formal fallacy*, or a direct violation of the canons of syllogism. Logicians enumerate as many different kinds of formal fallacy as they give of canons of syllogism, from four to eight. See below.

> No man was less likely to be imposed upon by *fallacies* in argument, or by exaggerated statements of fact.
> *Macaulay*, Boswell's Johnson.

> The lazy belief that in some unspecified way things will so adjust themselves as to prevent the natural consequences of a wrong or foolish act is a very common *fallacy*. *J. Fiske*, Evolutionist, p. 221.

> A *fallacy* is used to mean: (1) A piece of false reasoning, in the narrower sense; either an invalid immediate inference, or an invalid syllogism; a supposed equivalent form which is not equivalent, or a syllogism that breaks one of the rules. (2) A piece of false reasoning, in the wider sense; whereby from true facts a false conclusion is inferred. (3) A false belief, whether due to correct reasoning from untrue premises (reasons or sources) or to incorrect reasoning from true ones. (4) Any mental confusion whatever. *A. Sidgwick*, Fallacies.

Fallacies in things, according to the old logicians, fallacies that are not in words. They are of seven kinds: (1) The *fallacy of accident*, arising when a syllogism is made to conclude that, because a given predicate may be truly affirmed of a given subject, the same predicate may be truly affirmed respecting all the accidents of that subject. (2) The *fallacy of speech respective and speech absolute*, occurring when a proposition is affirmed with a qualification or limitation in the premises, but virtually without the qualification in the conclusion. (3) The *fallacy of irrelevant conclusion*, or *ignoration of the elench*, occurring when the disputant, professing to contradict the thesis, advances another proposition which contradicts it in appearance but not in reality. (4) The *fallacy of the consequent*, or *non sequitur*, an argument from consequent to antecedent, which may really be a good probable argument. (5) *Begging the question*, or the *petitio principii*, a syllogism, valid in itself, but in which that is affirmed as a premise which no man who doubts the conclusion would admit. (6) The *fallacy of false cause*, arising when, in making a reductio ad absurdum, besides the proposition to be refuted, some other false premise is introduced. (7) The *fallacy of many interrogations* in which two or more questions are so proposed that they appear to be but one: as, "Have you lost your horns?" a question which implies that you had horns.—**Fallacies of composition and division**, fallacies which arise when, in the same syllogism, words are employed at one time collectively, and at another distributively, so that what is true in connection is inferred to be also true in separation, or the reverse.—**Fallacy of accent**, a fallacy arising from the mode of pronouncing a word.—**Fallacy of amphibology**, a fallacy arising from the doubtful construction of a sentence.—**Fallacy of an illicit process**, a false syllogism in which a term enters into the conclusion with a different distribution from what it had in the premise.—**Fallacy of equivocation**, a fallacy arising from the double meaning of a word.—**Fallacy of figure of speech**, a fallacy arising from a tropical use of language.—**Fallacy of homonymy**, a fallacy arising from the double meaning of a single word.—**Fallacy of illicit particularity**, a syllogism in which the degree of particularity of the conclusion is different from the sum of those of the premises. See *particularity*.—**Fallacy of no middle**, a false syllogism in which the premises have no term in common that is dropped from the conclusion.—**Fallacy of undistributed middle**, a syllogism in which the middle term is undistributed in both premises: as, He who says that you are an animal speaks truly; he who says that you are a goose says that you are an animal; therefore, he who says that you are a goose speaks truly.—**Fallacy of unreal middle**, a fallacy which fails to assert the existence of any object of the kind denoted by the middle term: as, Pegasus was a horse, and Pegasus had wings; therefore, some horse has had wings.—**Semilogical fallacy**, or **fallacy in words**, a fallacy which deceives by some defect of language, and ceases to do so when the meaning of the propositions is strictly analyzed.

4. In the most general sense, those who descend from a common progenitor; a tribe or race; kindred; lineage. Thus, the Israelites were a branch of the *family* of Abraham; the whole human race constitutes the human *family*.
Hence—**5.** Any group or aggregation of things classed together as kindred or related from possessing in common characteristics which distinguish them from other things of the same order. Thus, a body of languages regarded as representatives of a common ancestor, or as having come by gradual processes of alteration and divarication from the same original tongue, is called a family: as, the Indo-European *family*; the South African *family*.

There be two great *families* of things, sulphureous and mercurial. *Bacon*, Nat. Hist.

The states of Europe were, by the prevailing maxims of its policy, closely united in one *family*. *Everett.*

Specifically—**6.** In scientific classifications, a group of individuals more comprehensive than a genus and less so than an order, based on fewer or less definite points of physical resemblance than the former, and on more or more definite ones than the latter. In zoölogy the name of a family now almost invariably ends in *-idæ*, which has the force of a patronymic. The prime divisions of a family are termed *subfamilies*, and end usually in *-inæ*. The prime associations of families are in some refinements of classification called *superfamilies*; there is no obvious distinction, however, between these and suborders. The recognition and definition of the family, as of other zoölogical groups, is entirely a matter of expert opinion, having no natural necessity for being; hence the wide difference among zoologists in their evaluation of the term. A modern family is usually less comprehensive than a genus as used in the last century. The use of the regular termination *-idæ* has done much to fix the valuation of the family more stably than that of either the genus or the order. Zoölogical families are considered as being approximately of the same grade in classification as the groups called orders in botany. Hence the word *family* is generally used by botanists as a synonym of *order*: as, *order Ranunculaceæ*, the crowfoot *family*. In cryptogamic botany the family is the prime division of the order or suborder, and the prime division of the family is the *subfamily* or tribe; but in some classifications the family is made to rank next below the tribe. The absolute rank of the family also varies with different authors, the family of one being the order of another, etc. The usual termination is *-eæ* (or *-ei*), but *-aceæ* (or *-acei*) is used as a family termination in some cases. See *classification*.

Go! if your ancient, but ignoble blood

8. Descent; especially, noble or respectable stock: as, a man of good *family*.

farm^{1} (färm), *n.* [Early mod. E. also *farme*, *ferme*; < ME. *ferme*, rent, revenue, particularly as collected by a 'farmer,' factor, or steward, hence also stewardship; also a meal, a feast; < AS. *feorm* (fem., gen. acc. etc., *feorme*), provision, food, supplies; provisions, etc., supplied by a vassal or tenant to his lord, esp. to the king; hence an estate from which such supplies are due (*cyninges feorm*, late AS. *cynges feorme-hām*, 'king's farm'); hence also a meal, a feast, and, generally, entertainment (of a guest or, as a tenant's duty, of his lord), harboring (of a fugitive); also, rarely, use, advantage (> *feormian*, *ge-feormian*, supply with food, sustain, entertain, receive (a guest), harbor (a fugitive), etc., > *feormere*, a purveyor (of a guild), *feormung*, and *fyrmth*, a harboring (of fugitives), etc.); orig. perhaps 'a living, means of subsistence,' connected with *feorh*, life, = OS. *ferah*, *ferh* = OHG. *ferah*, *ferh*, MHG. *verch* = Icel. *fjör*, life, = Goth. *fairhwus*, the world. But as AS. *feorm* is always rendered in ML. by *firma* or *ferma*, which is formally identical with the fem. of L. *firmus*, ML. often spelled *fermus* (> OF. *ferme*, ME. *ferme*, > mod. E., with restored L. vowel, *firm*), most writers have assumed the actual identity of the two words (L. *firma*, fem. adj., and ML. *firma* or *ferma*, n.), "either because the farms were at first inclosed or fortified with walls, or because the leases were confirmed or made more certain by signature": see *firm*, *a.*, *firm*, *v.*, *firm*, *n.* But the AS. form appears to be the original. The ML. *ferma*, *firma* has the AS. senses, and, later, the senses of rent, revenue, particularly as collected by a farmer or factor, also in general a tax, tribute, impost. Hence OF. *ferme*, F. *ferme* = Pr. *ferma*, in same senses, the OF. being partly the source of the ME. form. The mixture of forms and senses has confused the history of the word. The purely agricultural sense is comparatively modern.] 1. faro (fā′rō), *n.* [Also written *pharao*, *pharaon*, after F. *pharaon*; said to be named from a figure formerly on one of the cards, representing Pharaoh, King of Egypt.] A game played by betting on the order in which certain playing-cards (with reference simply to face-value) will appear when taken singly from the top of the pack. The players sit at one side of a table, and the dealer at the other. The dealer always represents the bank, having in charge the paying and claiming of bets. In the United States the table has on its center the "lay-out," or representation of thirteen cards, from the ace up to the king, in regular order. After bets have been placed on single cards or combinations, the dealer removes the top card from a complete pack placed face up in a box, which card does not count; he then withdraws the next one, leaving the third exposed, and claims all bets made on the card equal in value to the one withdrawn and pays those made on the other; the appearance together of two cards of the same value is called a "split," and the better loses half of his stake. Any bet may be "coppered" by placing a button on top of the money or checks, and this changes the bet to one that the card will show for the dealer. The showing of two cards constitutes a "turn," and after each turn new bets are made for another, down to the last three cards of the pack; the only betting allowed after this is on "calling the turn," or guessing which will show first. The European game is essentially the same, except that the layout is arranged in a small book.

2. Voluntary abstinence from food, as a religious penance or discipline, as a means of propitiation, or as an expression of grief under affliction present or prospective. Roman Catholic theologians distinguish between *natural* and *ecclesiastical fasts*. In the former, which are required of those who are about to communicate, there is a total abstinence from all food and drink; the latter imposes certain limits and restrictions as regards both the kind and the quantity of the food.

3. A time of fasting; the prescribed period or duration of abstinence. The only fast ordained by the Mosaic law was that of the day of atonement; but other fasts were subsequently instituted on account of great national calamities, and special fasts also were appointed on account of special impending peril. In the Roman Catholic Church all baptized persons over twenty-one years of age are required to observe appointed days of fasting, on which, subject to certain exceptions and exemptions, as the requirements of health, they are required not to eat more than one full meal. These days include the forty days of Lent, the ember-days, the Fridays of the four weeks of Advent, and the vigils of Pentecost or Whit-Sunday, of the feasts of St. Peter and St. Paul, of the Assumption of the Virgin Mary, of All Saints, and of Christmas day. All Fridays not fast-days are days of abstinence. (See *fast-day*, 1.) In the Greek Church, in addition to the forty days of Lent, there are three principal fasts, each lasting a week: (1) that of the Holy Spirit, immediately after Pentecost; (2) that of the Virgin, in August; and (3) that of the Nativity. In the Episcopal Church, Ash Wednesday and Good Friday are fasts; Lent, the ember-days, the three rogation-days, and all Fridays are only days of abstinence.

The *fast* of the fourth month, . . . and the *fast* of the tenth shall be to the house of Judah joy and gladness, and cheerful feasts.

Sw. *fastedag*), < *fæsten*, fast, + *dæg*, day.] **1.** A day on which fasting is observed; specifically, a day appointed for fasting as a religious observance by some recognized authority, ecclesiastical or civil; in the most restricted ecclesiastical sense, a day on which, or on part of which, total abstinence from food is prescribed, in contradistinction to a day on which a limitation is imposed on the kind or quantity of food to be taken, called a *day of abstinence*. See *fast^3*, *n.* In some of the United States, especially in New England, special days of fasting and prayer are appointed by the governor of the State, a custom derived from the original Puritan settlers.

The Pilgrims found it written, "They that sow in tears shall reap in joy. He that goeth forth and weepeth, bearing precious seed, shall doubtless come again with rejoicing, bringing his sheaves with him." This beautiful poetry was translated into the policy of the Pilgrims by establishing a *Fast-day* in March or April, and a Day of Thanksgiving in November. Thus the whole people were to pass through the two gates of the year, Tears and Smiles, and observe them as Holy Days, all other profane and misleading festivities—Christmas, New Year's, and Saint's days without number—being laid aside.
H. W. Beecher, Norwood, xlix.

2. In Scotland, a day set apart for humiliation and prayer; specifically, a day thus observed during the week immediately preceding certain celebrations of the Lord's supper. Business is generally suspended during these fast-days. Formerly their observance on fixed half-yearly or yearly dates, differing for different localities, was universal; but the growing tendency to make them mere holidays has led to their abolition in Edinburgh, Glasgow, and elsewhere.

II. *n.* [= D. *vet*, G. *fett*, Sw. *fett* = Dan. *fedt*, fat, n.; from the adj.] **1.** A white or yellowish oily solid substance forming the chief part of the adipose tissue of animals, and also found in plants. In chemistry the fats are odorless, tasteless, colorless or white bodies, which may be either solid or liquid. They are insoluble in water and cold alcohol, but dissolve freely in ether, chloroform, and benzine. The solid neutral fats, like spermaceti, suet, and lard, and the liquid non-volatile oils, like sperm- and olive-oil, are classed together as fats. They are compound ethers formed by the union of fatty acids with the triatomic alcohol glycerin. They are composed of carbon, hydrogen, and oxygen, but contain no nitrogen. The most common and abundant are stearin, palmitin, and olein. Of these stearin and palmitin are solids at ordinary temperatures, and olein is a liquid. Most animal and vegetable fats are mixtures of two or more of the simple fats, and their hardness depends largely on the relative quantity of olein or other liquid fat in them. When a fat is treated with an alkali, the fatty acid unites with the alkaline base, making a soap, and glycerin is set free. When a soap is treated with an acid, the base is taken from the fatty acid which is thus set free.

It. *fatalismo*; as *fatal* + *-ism*.] **1.** The doctrine that all things are subject to fate, or come or go by inevitable predetermination. *Fatalism* is a doctrine which does not recognize the determination of all events by causes, in the ordinary sense; holding, on the contrary, that a certain foreordained result will come about, no matter what may be done to prevent it. *Fatalism* is thus directly opposed to *necessitarianism*, according to which every event is determined by the events which immediately precede it, in a mechanical way. *Necessitarianism* seems hardly to leave room for final causes, while *fatalism* is the doctrine that certain results are sure to come in spite of all that efficient causes may do to prevent them. See *necessity*.

To confute these three *fatalisms*, or false hypotheses of the system of the universe, Cudworth designed to dedicate three great works—one against atheism, another against immoral theism, and the third against the theism whose doctrine was the inevitable "necessity" which determined all actions and events, and deprived man of his free agency. *I. Hence (from L. *festum*) *festal, festival*, etc.] **1.** A festival in commemoration of some event, or in honor of some distinguished person; a set time of festivity and rejoicing: opposed to *fast.* In this sense the word is almost entirely confined to ecclesiastical feasts. In the Jewish church the most important feasts, apart from the sabbath, were those of the Atonement, the Passover, Tabernacles, and Pentecost. To these were subsequently added the feasts of Purim and the Dedication. In the Christian church Christmas and Easter are feasts of almost universal recognition and observance. To these many others have been added, celebrating events in the life of Christ or in the lives of the apostles, saints, and martyrs. Feasts are divided into *movable* and *immovable*, according as they occur on a specific day of the week succeeding a certain day of the month or phase of the moon, or at a fixed date. Easter is a movable feast, upon which all other movable feasts depend; Christmas is an immovable feast. In the Roman Catholic Church feasts are further divided into *obligatory* and *non-obligatory*, and again into *doubles, semi-doubles, simples*, etc., according to the religious offices required to be recited in the church service.

See *semi-double* and *simple.*—**Feast of asses.** See *feast of fools.*—**Feast of Dolors.** See *dolor.*—**Feast of Eggs.** See *Egg Saturday*, under *egg*^{1}.—**Feast of fools** and **feast of asses**, festivals, simulating the Saturnalia, and perhaps a survival of them, celebrated in many countries of Europe, especially in France, during the middle ages, from Christmas to Epiphany, but chiefly on the 1st of January in each year. In the feast of fools a bishop, archbishop, or pope of fools was chosen and placed on a throne in the principal church, and a burlesque high mass was said by his orders. The feast of asses, following the former or celebrated on a later day, was a pageant that owed its name to the important part which the ass played in it. In some places the allusion was to the ass of Balaam, in others to the ass which is said to have stood beside the manger in which the infant Saviour was laid, or to the ass on which Mary and the child fled into Egypt, or, in others still, to the ass on which Jesus made his triumphal entry into Jerusalem. Some of the features of these festivals still survive in the carnival.—**Feast of lanterns**, a Chinese festival held annually at the first full moon of the year (the 15th day of the first month), when colored lanterns are hung at every door, and the graves are illuminated.—**Feast of Maccabees**, in the ancient Christian church, a festival celebrated annually in honor of the seven Maccabees, who died in defense of Jewish law. It is uncertain on what day the festival was held, but the Roman Catholic martyrology places it on the 1st of August.—**Feast of orthodoxy, of the federation, of the Sacred Heart, of the Presentation**, etc. See *orthodoxy, federation, heart*, etc.—**To make feast†**, to show gladness; pay flattering attention; give friendly entertainment.

=**Syn. 2.** *Feast, Banquet, Festival.* The idea of a social meal of unusual richness or abundance, for the purposes of pleasure, may be common to these words. *Feast* is generic; specifically, it differs from *banquet* in the fact that at a *feast* the food is abundant and choice, while at a *banquet* there is richness or expensiveness, and especially pomp or ceremony. The essential characteristic of a *festival* is concurrence in the manifestation of joy, the joyous celebration of some event, feasting being a frequent but not necessary part: as, to hold high *festival*. =**Syn.** *Deed, Feat, Exploit, Achievement.* These words are arranged in the order of strength; *deed*, however, may have a much more elevated character than *feat*, and even surpass *exploit*. A *deed* may, on the other hand, be base or ignoble. It is, therefore, often accompanied by an adjective of quality. A *feat* is generally an act of remarkable skill or strength: as, the *feats* of a juggler, a ventriloquist, an athlete. An *exploit* is especially an act of boldness or bravery, with various degrees of mental power in working it out. An *achievement* is the result of large ability in planning, and diligence and boldness in executing. *Feat, exploit*, and *achievement* differ from *act, action*, and *deed* in that the first three always, and the last three only sometimes, represent something great.

Feathers are extremely modified scales. The nearest approach to them in animals other than birds is probably the quills of the porcupine. Feathers are epidermal, non-vascular, and non-nervous appendages, consisting of a horny and pithy substance, and subject to periodical molt. They grow somewhat like hairs, in a little pit or pouch formed by an inversion of the dermal layer of the integument, in a closed follicle, upon a peculiarly molded papilla, which causes the feather to assume its special shape. They are seldom implanted uniformly over the surface, but grow in special tracts or areas separated by naked spaces. (See *pteryla, apterium.*) All of a bird's feathers collectively considered constitute the *plumage* or *ptilosis*. (See cut under *bird*1.) A perfect feather consists of a main stem, *shaft*, or *scape*; a supplementary stem, *aftershaft*, or *hyporachis*; and vanes, webs, or *vexilla*: these together making the *standard*. The scape is divided into two parts: one, nearest the body of the bird, is the *barrel, quill*, or *calamus*, a hard, horny, hollow, semi-transparent tube with one end inserted in the skin; it bears no webs, and passes insensibly at a point marked by a little pit (*umbilicus*) into the shaft proper or *rachis*. This is squarish in section, tapers to a fine point, is highly elastic, opaque, and solidly filled with dry pith; it bears the vexilla. The aftershaft is usually like a miniature of the main feather, springing from the stem of the latter at the junction of the calamus and rachis. (See *aftershaft.*) With its vanes it is called the *hypoptilum*. Sometimes it is as large as the main feather. There are two vanes, on opposite sides of the rachis. Each vane consists of a series of mutually appressed, thin, flat, linear or lancelinear plates, the *barbs*, set off obliquely from the rachis by their basal ends at a varying open angle. (See cut under *barb*1.) To cause these plates to cohere with one another, and make a webbing of the vane, each barb bears secondary vanes; these are *barbules*, and bear to the barbs the same relation that the barbs bear to the rachis. Barbules are also fringed, as if frayed out, along their lower edges; each such fringe makes a tertiary vane. When these vanes are simple, they are termed *barbicels*; when hooked, *hooklets* or *hamuli*. (See cut under *barbule.*) From such perfect structure feathers may be reduced in various ways, even to lacking everything but the shaft; when this is very thick, feathers become much like scales, as in the penguin; when it is fine, they resemble hairs or bristles. In general, three types of feather-structure are recognized: (1) The perfectly feathery, *plumous* or *pennaceous*, structure. The goose-quill used as a pen is a good example (though it lacks an aftershaft). Most contour-feathers are pennaceous. (2) The downy or *plumulaceous*, such as makes up the under-plumage or down. (3) The *filoplumaceous*, which approaches a bristle or hair. (See cut under *filoplume.*) But there is no strict line of demarcation, and in fact most feathers are pennaceous with plumulaceous bases of the webs. Feathers are also classified as (1) *pennæ, plumæ*, or contour-feathers; (2) *plumulæ*, or down-feathers; (3) *semiplumæ*, or half-feathers; (4) *filoplumæ*, or thread-feathers; and (5) *pulviplumæ*, dust-feathers, or powder-down. (See phrases below.) The acquisition of feathers is called *endysis*; their loss, *ecdysis*. Birds which acquire feathers in the egg are *Præcoces* or *Ptilopædes*; those which are hatched naked are *Altrices, Psilopædes*, or *Gymnopædes*. Feathers are of extremely rapid growth. They are of many shapes, often remarkable, and of every possible color. The color is usually due to actual pigmentation, but in many cases to iridescence. The optical effect of iridescence is due to the texture of the webs. Among all epidermal structures, feathers probably combine in the highest degree the qualities of lightness, strength, and elasticity. They are also very warm, and in many cases water-proof.

[In most modern editions the word in this passage is printed *feodary*, a form of different origin and meaning. The original folio of 1623 has *fædarie*. See *federary*.]

I cannot distrust the successful acceptation, where the sacrifice is a thrifty love, . . . and the presenter a *fedary* to such as are masters, not more of their own fortunes than their own affections. *Ford*, Line of Life.

feddan (fed′an), *n.* [Ar. *fadān*, *faddān*, a plow with yoke of oxen.] A land-measure of the Levant, consisting of as much as a yoke of oxen can plow in a day. In Egypt the legal feddan (according to the official statement dated 1831, transmitting standards to the Russian government, and according to the measure of one of those standards by the Russian commission) is 1.08 English acres; while under the Mamelukes it was 1.3 acres.

The *fedda'n*, the most common measure of land, was, a few years ago, equal to about an English acre and one tenth. *E. W. Lane*, Modern Egyptians, I. 371.

2. Confederated; founded on an alliance by confederation or compact for mutual support: as, the *federal* diet of the old German empire. —**3.** Pertaining to a union of states in some essential degree constituted by and deriving its power from the people of all, considered as an entirety, and not solely by and from each of the states separately: as, a *federal* government, such as the governments of the United States, Switzerland, and some of the Spanish-American republics. A *federal* government is properly one in which the federal authority is independent of any of its component parts within the sphere of the federal action: distinguished from a *confederate* government, in which the states alone are sovereign, and which possesses no inherent power.

The wants of the union are to be supplied in one way or another: if by the authority of the *federal* government, then it will not remain to be done by that of the state governments. *A. Hamilton*, Federalist, No. xxxvi.

The definition of treason against the United States . . . took notice of the *federal* character of the American government by defining it as levying war against the United States, or any one of them. *Bancroft*, Hist. Const., II. 149.

Both these leagues [the Achaian federation and the Ætolian League] were instances of true *federal* government, and were not mere confederations: that is, the central government acted directly upon all the citizens, and not merely upon the local governments. *J. Fiske*, Amer. Pol. Ideas, p. 76.

But Jefferson pointed out that party divisions must always exist in every free and deliberate society, and that if on a temporary superiority of the one party the other should resort to disunion, no *Federal* government could ever exist. *Schouler*, Hist. U. S., I. 422.

4. Favorable to federation; supporting the principle of a union of states under a common government; specifically, in the United States, relating to, or adhering to, the support of the Federal Constitution.—**5.** In the American civil war, pertaining to or supporting the Union or federal government.—**Federal City**, Washington, as the seat of the government of the United States.—**Federal Constitution.** See *Constitution of the United States*, under *constitution*.—**Federal headship**, in the system of federal theology, the headship of Adam, who is regarded as the federal head of the race, because he was the one with whom, as a representative of the race, the covenant of works was made by God, prior to the fall.—**Federal party**, in *U. S. hist.*, a name applied first to those who favored the adoption by the States of the Constitution framed by the Constitutional Convention at Philadelphia in 1787, and later to the party which in the first years of the federal government became fully formed under the leadership of Alexander Hamilton. It controlled the general government till 1801, then declined, and about 1824 became extinct. Its chief aims were the creation and maintenance of a strong central government, the strengthening of the spirit of nationalism, the control of politics by the more intelligent and substantial classes, the fostering of commercial interests, and the preservation of friendly relations with Great Britain.

On the one side, the undivided phalanx of the *federal party* (for they had not then taken the name of whig). *T. H. Benton*, Thirty Years, I. 225.

federalism (fed'ẹ-ral-izm), *n.* [= F. *fédéralisme* = Sp. Pg. It. *federalismo*; as *federal* + *-ism*.] The doctrine or system of federation or federal union in government; the principle of assigning to the care of a central government such matters of common concernment as may be agreed upon, and all others to that of the governments of the federated states, provinces, or tribes; more specifically, the aggregate principles or doctrines of a federal party, as the Federalists of the United States. Federalism has been practised by many uncivilized races, as the ancient German tribes and some of the American Indians, chiefly for warlike purposes. It existed for certain civil purposes also among the Greeks and other ancient and medieval peoples, as in the English heptarchy, was more largely developed in the old German empire, and has since been adopted in many countries, especially republics. (See *federal*, *a.*, 2.) Its introduction into France was advocated by the Girondists after the fall of the monarchy.

We see every man that the Jacobins choose to apprehend taken up, . . . whether he be suspected of royalism or *federalism*, moderantism, democracy royal, or any other of the names of the faction which they start by the hour. *Burke*, Policy of the Allies.

Intense Federalist as he was, his *Federalism* agreed with a stout anti-aristocratic spirit. *H. E. Scudder*, Noah Webster, p. 46.

Stated broadly, so as to acquire somewhat the force of a universal proposition, the principle of *federalism* is just this:—that the people of a state shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distinct governing body could possibly exercise; but that, as regards matters of common concern between a group of states, a decision shall in every case be reached, not by brutal warfare or by weary diplomacy, but by the systematic legislation of a central government which represents both states and people, and whose decisions can always be enforced, if necessary, by the combined physical power of all the states. *J. Fiske*, Amer. Pol. Ideas, p. 133.

The method by which *federalism* attempts to reconcile the apparently inconsistent claims of national sovereignty and of state sovereignty consists of the formation of a constitution under which the ordinary powers of sovereignty are elaborately divided between the common or national government and the separate States. *A. V. Dicey*, Law of Const., p. 131.

federalist (fed'ẹ-ral-ist), *n.* [= F. *fédéraliste* = Sp. Pg. It. *federalista*; as *federal* + *-ist*.] **1.** In *politics*, an advocate or a supporter of federalism; specifically, an advocate of a close union of states under a common government, or a supporter of such a union as against those who would weaken or destroy it; in *U. S. hist.* [*cap.*], a member of the Federal party. See *federal*, *a.*

And according to the degree of pleasure and pride we feel in being republicans ought to be our zeal in cherishing the spirit and supporting the character of *federalists*. *Madison*, Federalist, No. x.

The *Federalists* were the only proper tories our politics have ever produced, whose conservatism truly represented an idea, and not a mere selfish interest — men who honestly distrusted democracy, and stood up for experience, or the tradition which they believed for such, against empiricism. *Lowell*, Study Windows, p. 105.

The party name of *Federalist* has since become historical; and yet, to speak logically, it was the Anti-Federal party that sustained a federal plan, while the *Federalist* contended for one more nearly national. *Schouler*, Hist. U. S., I. 54.

The nation as such is brutally immoral. Taylor*, Mind, XIII. 431.

See *feud*^{2}. In this, which is its original sense, it implies the idea of reward for service or allegiance, and was used in contradistinction to estates in *allodium*, or entire property, which were generally small allotments held free of any obligation.

The tenure of lands is altogether grounded on military laws, and held as a *fee* under princes.
Hooker, Eccles. Polity, v. 80.

2. An estate of inheritance; an estate in land belonging to the owner and his heirs and assigns forever. In the latter case it is more specifically termed a *fee simple*. (See *conditional fee* (*b*), below.) The fee is the highest and most extensive interest that a person can have in lands. In this sense the king might have a fee, but not in the sense of def. 1. After the abolition of the feudal system the word continued to be used of real property; and although in the United States generally land is held in *allodium*, the private ownership, if subject to no paramount right except that of eminent domain vested in the State, is termed the *fee*. The word when unqualified may or may not mean an absolute or unqualified fee, or fee simple.

Base fee, a qualified fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, in the English law of settlements, the estate created by absolute alienation by a tenant in tail alone (see *entail*), which, being made without the consent of the protector, does not bar remaindermen or reversioners, but only the grantor's own issue, and hence is liable to be defeated by the failure of such issue.

The curious kind of estate created by the conveyance in fee simple of a tenant in tail not in possession, without the concurrence of the owners of estates preceding his own, is called a *base fee*. *F. Pollock*, Land Laws, p. 108.

Conditional fee. (*a*) Any fee granted upon condition. (*b*) A fee limited to particular heirs or a particular class of heirs, under the common-law rule that, on the donee's once having such heirs, the estate became absolute for all purposes of alienation, on the ground that a condition once performed was at an end. (See *entail*.) To designate this kind of conditional fee at the common law, the more appropriate phrase is *fee simple conditional*. This evasion of the intent of donors to reserve a reversion on a failure of heirs was put an end to by a statute known as *De Donis*, which enacted that the will of the donor should be observed, and that on the failure of heirs the property should revert to the donor. The estate of the donee under this statute was termed a *fee tail*. See *tail*^{2}, *a*. (*c*) Later, the term *conditional fee* was applied to the estate of a mortgagee of land, under a mortgage in the usual form, which was regarded as vesting the fee in the mortgagee subject to its being divested by performance of the condition, namely payment.—**Determinable fee,** a fee determinable by a condition or a conditional limitation; more specifically, a fee created by a limitation to the grantee and his heirs till the happening of a future event which may or may not happen, as a gift to A and his heirs, and if A dies without issue, then to another.—**Fee simple, fee simple absolute,** a fee that is not qualified. See def. 2.—**Fee tail.** See *conditional fee* (*b*). **Great fee,** the holding of a tenant of the crown.

By the feudal law, a *great fee* or great lordship, which are convertible terms, was the highest order of possession, and was held directly from the crown.

See *demain*.—**Limited fee,** a determinable fee; more specifically, a fee determinable by a conditional limitation.—**Plowman's fee,** peasant tenure; the custom by which lands descended to all the sons of the tenant in equal shares, with, however, some privilege or birthright in favor of the elder or younger son: a rule of descent which under the feudal system gave way to primogeniture.

Qualified fee, a base fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, the estate created by a limitation to the grantee and the heirs of an ancestor of his in the paternal line whose heir he also is, as a gift to B and the heirs of A, his father.

(*b*) More comprehensively, all that part of the sensory function (as the sensing of cold, hunger, etc.) which is not included in the special senses of sight, hearing, smell, and taste. See *touch*, *n.*

> Why was the sight
> To such a tender ball as the eye confined, . . .
> And not, as *feeling*, through all parts diffused?
> *Milton*, S. A., l. 96.

2. A sensation. Specifically—(*a*) A sensation conveyed by the sense of touch. (*b*) More comprehensively, sensation of any kind not assignable to one of the special senses of sight, hearing, taste, and smell: as, a *feeling* of warmth; a *feeling* of pain; a *feeling* of drowsiness.

> Some of the organs in their sound condition have no organic *feelings.* *G. T. Ladd*, Physiol. Psychology, p. 513.

3. The immediate quality of what is present to consciousness in sensation, desire, or emotion, considered apart from all activity of thought; the pure sense-element in consciousness; in a loose use, any element of consciousness not recognizable as thought or will. The word (that is, its equivalent) was introduced into philosophy as an exact term in this sense by Tetens, a German Wolffian philosopher of the eighteenth century. Kant modified the meaning, for the convenience of his system, so as to restrict it as in def. 4, below.

> The point which at present concerns us is simply that, when *feeling* is said to be the primordial element in consciousness, more is usually included under *feeling* than pure pleasure and pain, viz., some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. *J. Ward*, Encyc. Brit., XX. 40.

> I have in this volume used *Feeling* as the name for the genus of which Sensation (with Muscular Feeling) and Emotion are the two species.
> *A. Bain*, Emotions and Will, p. 615, App.

> It cannot be too strongly urged in the face of mystical attempts, however learned, that there is not a landmark, not a length, not a point of the compass in real space which is not some one of our *feelings*, either experienced directly as a presentation or ideally suggested by another *feeling* which has come to serve as its sign.
> *W. James*, Mind, XII. 208.

> *Feelings* which correspond directly with an interaction between the organism and its environment are termed sensations; those which correspond indirectly are termed emotions; and when the remoteness from direct correspondence is great, the *feeling* is in some cases termed a sentiment. *C. Mercier*, Mind, IX. 335.

> It may be needful to guard against a further misconception, and to state explicitly that the term *feeling*, the most general term in psychology, includes emotion, not less than sensation and perception.
> *G. H. Lewes*, Probs. of Life and Mind, II. iv. § 17.

4. In a restricted sense, pleasure or pain; any state or element of consciousness having a pleasurable or a painful aspect.

> As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (*a*) a touch, as *feeling* of roughness; (*b*) an organic sensation, as *feeling* of hunger; (*c*) an emotion, as *feeling* of anger; (*d*) *feeling* proper, as pleasure or pain. But, even taking *feeling* in the last, its strict sense, it has been maintained that all the more complex forms of consciousness are resolvable into, or at least have been developed from, *feelings* of pleasure and pain. *J. Ward*, Encyc. Brit., XX. 40.

> The *feeling*, the pleasurable or painful tone of the sensation, is always recognized as purely and simply a way in which the mind is affected.
> *G. T. Ladd*, Physiol. Psychology, p. 504.

See *emotion*, 2.

> Nor, again, can we admit without verification the proposition which some philosophers, including Aristotle (and Plato in some passages), seem to assume a priori: that the kind of *feeling* which is most pleasant or preferable as *feeling* will always accompany the kind of activity which we approve. *H. Sidgwick*, Methods of Ethics, p. 162.

Feigned exchange. See *exchange*.—**Feigned issue**, in *law*, an issue made up for trial by agreement of the parties or by an order of court, instead of by the ordinary legal procedure. Thus it was usual in chancery, when a disputed question of fact, more suitable to be determined by a jury than by the chancellor, arose in a suit, to order it submitted to a jury by means of pleadings framed as if an action at law had been brought on a wager involving the question, so as to present the question to the jury as the exact issue to be decided. This practice has been generally altered or supplanted by recent legislation providing for the framing of issues without the fiction of a separate action. =**Syn.** To affect, simulate, profess.

felapton (fe-lap'ton), *n.* In *logic*, the mnemonic name of that mood of the third figure of syllogism which has both the premises universal and one of them negative. The following is an example: The loss of energy of a radiating mass of gas which gravitates to its own center is an emission of heat; but no loss of energy in such a mass of gas can tend to make the body cooler; hence, some emission of heat does not tend to make the radiating body cooler. According to some logicians, this reasoning is fallacious, because neither premise asserts that such a case actually occurs. The word *felapton* is one of the mnemonic names invented in the thirteenth century, and found in the "Summulæ" of Petrus Hispanus. The three vowels, *e*, *a*, *o*, indicate the quantity and quality of the three propositions, which are universal negative, universal affirmative, and particular negative, respectively. The letter *f* signifies that the mood is to be reduced to *ferio*, and the *p* that in the reduction the minor premise is to be converted per accidens.

feldspar (feld'spär), *n.* [A var. of *feldspath*, accom. to E. *spar*2.] In *mineral.*, one of a very common group of closely related minerals, all silicates of aluminium, together with either calcium, sodium, potassium, or in one case barium. They crystallize in the monoclinic or triclinic system with closely similar angles. The prismatic angle is not far from 120°, and they have two easy cleavages which make an angle of 90°, or nearly 90°, with each other. Their specific gravity lies between 2.6 and 2.8, and their hardness between 6 and 7. In color they vary from clear and glassy to white, grayish, and light shades of yellow, red, or green, rarely darker green to black. They occur in distinct crystals, also in massive forms varying in structure from coarsely cleavable to granular-crystalline, compact, and hornstone-like. They form an essential constituent of many of the common crystalline rocks, as granite, gneiss, syenite, diorite, most kinds of basalt, andesite, trachyte, etc. The monoclinic feldspars are orthoclase and hyalophane. The former is a potash feldspar (see *orthoclase*), and is the commonest of the group; the latter is a baryta feldspar, and is a rare species. Closely related to orthoclase is the triclinic microcline (which see), having the same composition, but varying slightly in form. Besides these there are the triclinic (lime-soda) feldspars, called in general *plagioclase*, because of the oblique angle between their two cleavages, and forming a series varying progressively in composition, form, optical characters, and specific gravity from the lime feldspar anorthite to the sodium feldspar albite; the intermediate species are considered as isomorphous compounds of these two extremes in varying proportions. Those ordinarily recognized are, named in order, labradorite, andesin, and oligoclase, the last approaching most closely to albite. The increase in soda in the members of the series is accompanied by an increase of silica, the species being increasingly acidic in the order named: thus, anorthite contains 43 per cent. of silica, and albite 69 per cent. The specific gravity diminishes in the series from anorthite (2.75) to albite (2.61). Certain triclinic feldspars containing considerable potash and with an angle of cleavage varying but little from 90° are sometimes grouped under the name *anorthoclase*. Common feldspar, or orthoclase (and microcline), is much used in the manufacture of porcelain; some kinds are employed for ornaments, as aventurin feldspar or sunstone, also moonstone (an opalescent variety of orthoclase), albite or oligoclase, and, most of all, the species labradorite, beautiful for its play of colors. 5. (*a*) A station of privilege and emolument in English colleges which entitles the holder (called a *fellow*) to a share in their revenues. In Oxford and Cambridge the fellowships were either constituted by the original founders of the colleges to which they belong, or they have been since endowed. In almost all cases their holders must have taken at least the first degree of bachelor of arts, or of students in the civil law. Fellowships vary in value from about £30 to £250 a year and upward, and they all confer upon their holders the right to apartments in the college, and certain privileges as to commons or meals. Though many fellowships are tenable for life, in general they are forfeited upon attainment by the holder of a certain position in the church or at the bar, or upon his marriage. In this last case, however, a fellow may retain his fellowship by a special vote of the college. Except in the single case of Downing College, Cambridge, where graduates of Oxford and Cambridge are eligible, fellowships are confined to graduates of the university to which they belong. Many colleges now confer honorary fellowships to which no emoluments and no share in the government of the college are attached. (*b*) A scholarship or sum of money granted for one or more years to a graduate student to enable him to pursue his studies either at that college or university or abroad.

ML. *feltrum*, *filtrum*, > It. *feltro* = Sp. *fieltro* = Pr. *feutre* = OF. *feutre*, *fautre*, F. *feutre* = MGr. *ἀφέλετρον*, felt: see *felter* and *filter*^{1}, and cf. *feuter*^{1}.] 1. An unwoven fabric of short hair or wool, or of wool and fur, agglutinated or matted together, with the aid usually of moisture and heat, by rolling, beating, and pressure. The property of felting results chiefly from the serrated or jagged structure of wool and most hairs, as well as from the crimped or wavy form natural to some animal fibers. The making of felt is thought to have originated at a very early date in the western part of Asia, and the best and most durable felt is still made in Persia and the neighboring countries. Felt floor-mats an inch or more thick and of admirable texture and printed in rich designs in color are used upon marble and tiled floors in Persia. (See *numud*.) In Europe, throughout the middle ages and later, felt was a usual material for hats, and was also used for stuffing or bombasting garments for both defense and fashion. Felt is now in general use not only for hats, but for clothing and upholstery, carpets, table-covers, and mats, jackets for steam-boilers, etc., and lining for roofs and walls. Broadcloth and other fulled woolen fabrics are partially felted by the process of fulling; and the familiar shrinkage of woolen garments in washing results from an unsought felting, which draws the fibers of the fabric closer together.

Howbeit, they are of discretion to make *feltes* of Camels haire, wherewith they clothe themselues, and which they holde against the winde. *Hakluyt's Voyages*, I. 57.

(*c*) A compound of liquid cement and animal or vegetable fiber, applied with a brush for the same purpose.—**Paper-makers' felt**, a coarse, twilled, loosely woven material, neither teazeled nor shorn, used in paper-manufacture to place between wet sheets.—**Roofing-felt**, a material similar to lining felt, used as a covering for roofs. This material is usually not a true felt, but an agglutination of hair or other animal fibers, compounded with a preparation of tar, and rolled into sheets. It is nailed down upon the roof in overlapping strips, and is usually coated subsequently with tar, or some special heavy pigment having tar or asphalt as a basis and commonly called *cement*.

The word is one of the names of moods invented in the thirteenth century and attributed to Petrus Hispanus. Fermatian (fėr-mā′shian), *a.* Pertaining to the French mathematician Pierre de Fermat (1601–65).—**Fermatian reasoning**, reasoning in the following form: "A certain character, P, if possessed by any one of a linear series of subjects, is necessarily possessed by the next following subject: now, the character P is possessed by the first subject of the series: ergo, it is possessed by all the subjects." The discovery of this form of reasoning by Fermat opened the theory of numbers to the researches of mathematicians. It holds good even if the series is infinite, so long as it contains no member which cannot be reached by proceeding by successive steps from the first member, as is the case, for example, with the entire class of finite positive integer numbers. In this particular Fermatian reasoning is contrasted, for example, with the syllogism of transposed quantity, which holds only for finite classes. On the other hand, the Fermatian inference fails in such a case as the following: If Achilles, pursuing a tortoise, is behind it at any instant, then he will still be behind it when he reaches the point where the tortoise now is; but he is behind it at first; therefore, he will always be behind it. The following is equally absurd: If any whole number is finite, the next greater whole number is finite; but 1 is finite; hence, all whole numbers are finite.

fermentation (fėr-men-tā′shọn), *n.* [= F. *fermentation* = Sp. *fermentacion* = Pg. *fermentação* = It. *fermentazione*, < L. as if **fermentatio*(*n-*), < *fermentare*, ferment: see *ferment*.] 1†. A gentle boiling or ebullition.—2. A decomposition produced in an organic substance by the physiological action of a living organism or by certain unorganized agents. See *ferment*. Fungi (and especially species of *Saccharomyces*) and bacteria are the agents of fermentative processes or changes. Fermentation naturally ceases when the nutritive elements of the fermented substance are exhausted, or a sufficient proportion of a substance (as alcohol) deleterious to the ferment-organism is produced. It may be checked or altogether prevented by anything which prevents the growth of the organism, as by exclusion of the germs or spores, by subjection to a temperature too high or too low, by the presence of too large a proportion of sugar or of a substance (called an antiseptic) which acts as a poison to the organism. There are various kinds of fermentation, each of which is caused by special organisms. *Alcoholic fermentation* in saccharine solutions, or fermentation in its most restricted sense, may be produced by any of several organisms, including several species of *Saccharomyces*, *Mucor*, *Penicillium*, and *Aspergillus*, and to a slight extent by certain other fungi; but the most important agent is *Saccharomyces cerevisiæ*, which produces the fermentation of beer. In fermenting wine, several species of *Saccharomyces* are found. *S. Mycoderma* forms a mold-like growth on the surface, the so-called *flowers of wine*. *Acetous fermentation* takes place in liquids which have undergone alcoholic fermentation, and is caused by *Micrococcus* (*Mycoderma*) *aceti*, the vinegar-plant. The alcohol is oxidized, and acetic acid or vinegar is the result. This micrococcus takes two forms: the immersed or anaërobiotic form exists as a mucilaginous mass called the *mother of vinegar*; the other is the surface or aërobiotic form, the *flowers of vinegar*. According to Pasteur, the latter only is active in producing fermentation. *Lactic fermentation*, or souring of milk, is induced by certain bacteria which decompose the sugar of milk and produce lactic acid. *Viscous fermentation* is of two kinds: the one is caused by certain bacteria which convert the fermenting substance into a slimy mass and produce mannite; the other is caused by *Leuconostoc mesenterioides*, which brings about the slimy condition, but does not produce mannite. The latter occurs in saccharine solutions, and is a source of serious loss to sugar-manufacturers on the European continent. The agent in *butyric fermentation* is *Bacillus amylobacter*, and butyric acid is the result. Certain fermentative changes are produced in wood by various fungi. *Putrefactive fermentation*, or putrefaction, occurs in animal substances and plant products containing a large proportion of nitrogenous matter. The organism which is active in the putrefaction of beef is *Bacterium termo*. The ammoniacal fermentation of urine is caused by *Micrococcus ureæ*. See *putrefaction*, *bacterium*, and *germ theory*, under *germ*.

Fermentation is a very general phenomenon. It is life without air, or life without free oxygen, or, more generally still, it is the result of a chemical process accomplished on a fermentable substance.

3. Figuratively, the state of being in high activity or commotion; agitation; excitement, as of the intellect or feelings, a society, etc.

fermeture (fėr′me-tụ̄r), *n.* [F. (= It. *fermatura*), a fastening, shutting, stop, < *fermer*, shut, fasten, < L. *firmare*, make fast: see *firm*, *v.*] A mechanism for closing the bore or chamber of a breech-loading small-arm or cannon; a breech-closing apparatus. The Krupp fermeture consists of a cylindroprismatic wedge furnished with a Broadwell ring to serve as a gas-check. This wedge slides transversely in a mortise in the steel breech-piece, and in the large calibers it is moved in and out by a translating screw on one side. The block is locked in position by a second screw having a part of its thread cut away so that a partial turn causes it to engage or disengage in the breech of the gun. The French or interrupted-screw fermeture is a steel screw with its exterior divided into sextants or arcs of 60° each. The screw-threads are removed from the alternate arcs, which thus present a plain cylindrical surface. The interior surface of the breech of the gun is similarly formed with alternate blank and threaded sectors. In closing, the threaded sectors on the block are brought opposite the blanks in the breech, and the block is inserted by turning a translating screw; then one sixth of a turn of the block to the right engages the threads on the block with those in the breech and closes the chamber. The De Bange or Freire gas-check is generally used with this system of fermeture. The fermeture of the Hotchkiss mountain-gun consists of a simple prismatic wedge, with a locking screw engaging in a recess in the breech. A handle on one side serves to close and draw out the block, and to lock it. This form of block has merely to support the head of the cartridge-case, which acts as its own gas-check. The fermetures for small-arms present a great variety of combinations and movements. The most important are the rotating breech-block, as in the United States Springfield and Martini-Henry rifles; the sliding breech-block, as in the Sharps and Winchester rifles; and the sliding bolt, as in the Hotchkiss and Chaffee-Reece rifles. In all modern small-arms the metallic cartridge-case serves as a gas-check or obturator. See *gas-check*, *interrupted screw* (under *screw*), *obturator*, and cut under *cannon*.

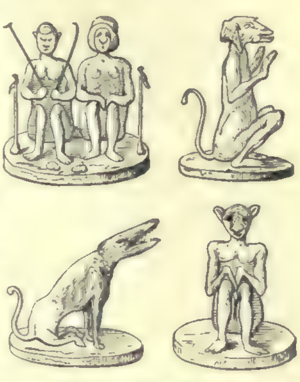
Some compare Skt. *parna*, wing, feather, leaf, tree (applied to various plants); the same connection of thought appearing in the Gr. *πτερίς*, a fern, *πτερόν*, a wing, feather, = E. *feather*.] One of a large group of vascular cryptogamous plants, constituting the natural order *Filices*. They are herbaceous, rarely shrubby or arborescent plants, sometimes with long creeping rhizomes. But in many cases the rootstock or caudex is erect, when the species is called a *tree-fern*. The fructification, which is asexual, consists of spores produced in sporangia upon the backs or margins of the fronds. The sporangia in most genera are collected in definite clusters (sori), and these are usually covered by a special covering membrane, or one formed from the margin of the frond, called an *indusium*. Each sporangium is formed from a single epidermal cell. In the largest suborder, the *Polypodiaceæ*, the sporangia are stalked and provided with a vertical, many-jointed ring, which ruptures at maturity, allowing the escape of the spores. In the other suborders the ring is less perfectly developed, or wanting. The spores in germination produce a green prothallium upon the surface of the soil, and upon the under surface of the prothallium antheridia and archegonia are monœciously produced. After fertilization the germ-cell of the archegonium develops into a frond-bearing plant. About 2,500 species of ferns are known. They are found all over the world, but abound in humid temperate and tropical regions. Great Britain has about 50, temperate North America about 160, India about 600. Ferns are very abundant as fossil plants. The earliest known forms occur in Devonian rocks, and their remains are very common in connection with coal of the Carboniferous period. Plants of the related group *Ophioglossaceæ* also are called ferns.—**Christmas fern.** See *Christmas*.—**Cloak-fern**, a species of *Notholæna*.—**Filmy fern**, a species of the genus *Hymenophyllum*, found on moist rocks and in copses.—**Flowering fern**, a fern of the genus *Osmunda*, especially *O. regalis*. This plant, which is common in Europe and America, growing in boggy places and wet woods, forms tufts of large bipinnate fronds. In the fertile fronds the upper pinnæ are transformed into a handsome panicle of sporangia. **Hare's-foot fern**, *Davallia Canariensis*.—**Maidenhair fern**, species of *Adiantum*, especially *A. pedatum* and *A. (the word having come into general European use in consequence of the work of Charles de Brosses, "Du Culte des Dieux *fétiches*," 1760); = D. *fetiche* = Sw. Any material object regarded with awe, as having mysterious powers residing in it or as being the representative or habitation of a deity to which worship may be paid, and from which supernatural aid is to be expected. A fetish may be an animal, as a cock, a serpent, a bear, etc., or an inanimate object, as a tree, a river, a stone, a tooth, a shell, a shaving, etc. The worship of fetishes belongs to a low and brutish stage or form of religion.

When the king [in Guinea] will sacrifice to *Fetisso*, hee commands the *Fetissero* [Pg. *feiticeiro*, sorcerer] to enquire of a Tree, whereto he ascribeth Diuinitie, what hee will demand. *Purchas*, Pilgrimage, p. 651.



Fetishes of Dahomey, Africa.

To class an object as a *fetish* demands explicit statement that a spirit is considered as embodied in it or acting through it or communicating by it, or at least that the people it belongs to do habitually think this of such objects; or it must be shown that the object is treated as having personal consciousness and power, is talked with, worshipped, prayed to, sacrificed to, petted or ill-treated with reference to its past or future behaviour to its votaries. *E. B. Tylor*, Prim. Culture, II. 133.

Before experience had yet taught men to distinguish between the possible and the impossible, and while they were ready on the slightest suggestion to ascribe unknown powers to any object and make a *fetish* of it, their conceptions of humanity and its capacities were necessarily vague and without specific limits. *H. Spencer*, Universal Progress, p. 66.

Hence—2. An object of blind devotion; an idol: as, gold has become his *fetish.*

fetishism (fē'tish-izm), *n.* [Also, after the French, *fetichism*, and sometimes *feticism*; = F. *fétichisme*; as *fetish* + *-ism.*] 1. The practice of worshiping a fetish; that form of religious belief and practice in which fetishes are the objects of worship. See the extracts.

The President de Brosses, a most original thinker of the last century, struck by the descriptions of the African worship of material and terrestrial objects, introduced the word *Fétichisme* as a general descriptive term; and since then it has obtained great currency by Comte's use of it to denote a general theory of primitive religion, in which external objects are regarded as animated by a life analogous to man's. . . . It seems to me . . . more convenient to use the word Animism for the doctrine of spirits in general, and to confine the word *Fetishism* to that subordinate department which it properly belongs to: namely, the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects. *Fetishism* will be taken as including the worship of "stocks and stones," and thence it passes by an imperceptible gradation into Idolatry. *E. B. Tylor*, Prim. Culture, II. 132.

Fetichism is almost the opposite of Religion; it stands towards it in the same relation as Alchemy to Chemistry, or Astrology to Astronomy, and shows how fundamentally our idea of a deity differs from that which presents itself to the savage. The Negro does not hesitate to punish a refractory Fetish, and hides it in his waistcloth if he does not wish it to know what is going on. Aladdin's lamp is, in fact, a well-known illustration of a Fetish. *Sir J. Lubbock*, Orig. of Civilisation, p. 349.

A latent *fetishism*, which is betrayed in that love of personification, or of applying epithets derived from sentient beings to inanimate nature, . . . is the root of a great part of our opinions. *Lecky*, Europ. Morals, I. 372.

Feudal system, a system of political organization with reference to the tenure of land and to military service and allegiance prevalent in Europe in the middle ages. Its main peculiarity was that the bulk of the land was divided into feuds or fiefs, held by their owners on condition of the performance of certain duties, especially military services, to a superior lord, who, on default of such performance, could reclaim the land. This superior might be either the sovereign, or some subject who thus held of the sovereign, and in turn had created the fief by subinfeudation. According to the pure feudal system, the lord was entitled to the fealty of his tenants, but not to that of their subtenants, every man looking only to his immediate lord. On the continent of Europe, while the system was in full operation, this principle made the great lords practically independent of their nominal sovereigns, who could command their allegiance only through their self-interest or by superior force; and therefore kings were often powerless against their vassals. In England, however, the sovereign was always entitled to the fealty of all his subjects. Feudal tenures were abolished in England by act of Parliament in 1660, in Scotland in 1747, and in France at the revolution of 1789. In Germany, Austria, etc., they continued till after the revolutionary movements of 1848–50. In each case, however, they had long previously been much mitigated in their social and political effects. A feudal system prevailed in China from a very early period, but was brought to an end in 220 B. C., on the conquest of the whole country by Siang Wang of Tsin, known as Tsin-shi-Hwang-ti. The feudal system of Japan was abolished in 1871, when the daimios or barons surrendered their lands to the mikado. See *daimio.*

'a trembling,' akin to Gr. *φέβεσθαι*, flee affrighted, *φόβος*, flight, panic fear, fear, terror.] 1. In *pathol.*: (*a*) A temperature of the body higher than the normal temperature, appearing as a symptom of disease; pyrexia. The temperature of the body in health is between 98° and 99° F., and is maintained at this point by the adjustment of the production of bodily heat to its dissipation, both of these processes being largely under nervous control. During the period of invasion of a fever, or at any time when the temperature is rising, the heat produced exceeds the heat lost. If the rise is very rapid, the withdrawal of the blood from the skin, which diminishes the loss of heat, may give rise to a cold sensation or chill, which may be combined with an attack of shivering. By the latter the production of heat is increased. During fever the production of heat, while it may be greater than in a healthy body at rest, does not exceed what a healthy body can dispose of without experiencing increase of temperature. The consumption of the tissues of the body in fever exceeds ordinarily the repair, and there is more or less emaciation; the excretion of urea is increased; the pulse is usually quickened as well as the respiration; the bowels are apt to be constipated; and thirst, loss of appetite, headache, and vague pains are commonly complained of. Fever is caused by zymotic poisons, by local inflammation, or by overheating as in sunstroke, and is sometimes of exclusively nervous origin. It is unquestionably injurious to the patient when it is excessive or too long continued; in some cases, where it does not exceed certain limits, it is very probably innocuous, or may even be advantageous. Fever would ordinarily be called slight up to 101° or 102° F., moderate up to 103° or 103.5°, and high above this. Temperatures above 105° F. would be called excessively high, and to such the name of *hyperpyrexia* is applied. The limits of the significations of these terms are not precisely marked; they vary somewhat in the usage of different individuals. The prognostic significance of pyrexia depends on the accompanying conditions. (*b*) The group of symptoms consisting of pyrexia and the symptoms usually associated with it. (*c*) A disease in which pyrexia is a prominent symptom: as, typhoid *fever*, scarlet *fever*, etc.

Typical cases, after an incubation of from five to eight days, with only slight prodromata, suddenly develop a high fever which lasts from five to seven days, and as suddenly disappears. With the high fever are associated malaise, anorexia, pains in the head, back, and limbs, muscular hyperalgesia, constipation or slight diarrhea, marked enlargement of the spleen, very frequent pulse, and a dirty-yellow complexion. The attack may recur after a week, and several such recurrences may take place. The mortality is from 2 to 4 per cent. For synonyms, see phrases above and below.—**Remittent bilious fever.** (*a*) Remittent fever. (*b*) Relapsing fever. After about one day the scarlet eruption appears, which lasts for three or four days in its original intensity, and then begins to fade out, when desquamation sets in. Among complications and consequences may be mentioned the formation of diphtheroid membranes in the throat, abscess of cervical lymphatic glands, inflammation of the ear, and acute inflammation of the kidneys. The contagion may preserve its vitality for months in clothes, bedding, carpets, etc. One attack usually protects against subsequent infection.—**Seasoning fever,** a mild form of (*a*) remittent fever; (*b*) yellow fever in new-comers.—**Septan fever,** intermittent fever in which the paroxysms recur on the seventh day (both paroxysmal days being counted).—**Septic fever,** the fever arising from ill-cared-for wounds, from the infection of the system with their morbid products or the bacterial germs flourishing in them.—**Seven-day fever.** (*a*) Same as *septan fever.* (*b*) Relapsing fever.—**Seventeen-day fever,** remittent fever with relapse on the seventeenth day.—**Sextan fever,** intermittent fever in which the paroxysms recur on the sixth day (both paroxysmal days being counted).—**Short fever,** relapsing fever.—**Siam fever,** yellow fever.—**Sierra Leone fever,** a form of remittent fever.—**Simple asthenic fever,** simple continued fever with debility.—**Simple continued fever,** a fever, usually mild, lasting from a few hours to a few days, independent of local inflammation, and neither in its features nor in the circumstances under which it arises disclosing its identity with other better-marked forms. Under the name are doubtless included in actual practice many mild and abortive cases of typhoid, malarial, and other fevers, some cases of purely neurotic origin, and possibly some dependent on a distinct unknown zymotic cause. Also called *synocha, synochus simplex, febricula, ephemera, ephemeral fever, sun-fever.*—**Slow nervous fever,** typhoid fever.—**Solar fever,** dengue.—**Spirillum fever,** relapsing fever.—**Splenic fever.** Same as *malignant anthrax* (which see, under *anthrax*).—**Spotted fever.** (*a*) Typhus fever. (2) A period of invasion of a week or less, characterized by a gradually increasing temperature, with morning remissions and evening exacerbations, want of appetite, thirst, dry and coated tongue, frequent pulse, headache, often nose-bleed, usually constipation, often slight diarrhea, slightly tympanitic abdomen, with perhaps some tenderness and gurgling in the right iliac region, some enlargement of the spleen, perhaps slight delirium at night, and some bronchitis. (3) A period of continued pyrexia (fever) in which the temperature ceases to rise, and in which its daily variations are less. This period (fastigium) lasts for a week or two. The want of appetite, thirst, dry tongue, frequent pulse, headache, and bronchitis continue or are increased. The tympanitis, splenic enlargement, and delirium become more pronounced. Three or four soft yellow stools are passed daily. About the beginning of this period an eruption of small, pink, slightly raised spots appears on the skin, especially of the back and abdomen. (4) A period of defervescence, in which the fever gradually disappears and all the symptoms improve. This may last about a week. Cases vary much from this typical progress, and may be marked in addition by intestinal hemorrhage, perforation of the intestinal wall with collapse and peritonitis, thrombosis of the larger veins, especially the femoral, pneumonia, lobular and (rarely) lobar, or meningitis. Relapses (after a normal temperature has been reached) and recrudescences (before the fever has entirely disappeared) are not very uncommon. The mortality varies, but the average of recent reports is not far from 10 per cent. The main anatomical features are inflammation of Peyer's patches and of the solitary glands of the small and sometimes of the large intestine, with inflammation of the mesenteric lymphatic glands. Persons between fifteen and thirty years of age seem to be most frequently attacked. A previous attack produces a certain but not complete protection. The contagium seems to be given off from the sick mainly by the stools. The contamination of food and drink seems to be the most important mode of ingress. Personal contact does not materially increase exposure. Typhoid fever is now believed to be caused by a microscopic parasitic organism or bacillus, in length about one third the diameter of a red blood-corpuscle, in thickness about one third of its length, with rounded ends, mobile, forming spores at a temperature between 30° and 42° C., but not at lower temperatures, and forming minute brownish-yellow colonies on gelatin, which it does not soften. For synonyms, see phrases above.—**Typhomalarial fever,** a febrile disease produced by the simultaneous action of the typhoid and malarial poisons. The term more often indicates a doubt whether the case is malarial or typhoid.—**Typhus fever,** a contagious fever which in typical cases presents the following features: A period of incubation of nine days or more, a sudden onset of fever, often with a chill, a period of continued fever with pains in the head, back, and limbs, dizziness, noise in the ears, frequent bronchitis, and enlarged spleen. An eruption appears on the third to the seventh day, in the form of small red spots, usually abundant over the trunk and limbs, which in two or three days more become hemorrhagic. In the second or third week the disease may terminate by a fall of temperature, which is usually quite rapid. Relapses are very rare. The mortality varies in different epidemics from 6 to 20 per cent. The most susceptible years are between the ages of twenty and forty. One attack affords considerable protection against a second. For synonyms, see phrases above.—**Urethral fever,** fever ensuing on an operation on the urethra, such as passing a catheter.—**Yellow fever,** an infectious disease of warm climates, typical cases of which present the following features: After a period of incubation varying from a day to several weeks, the invasion begins suddenly with headache, pains in back and limbs, often distinct chill, nausea, often vomiting, inactive bowels, fever (pyrexia) usually high, a pulse-rate less than corresponds to the pyrexia, sometimes vertigo, convulsions, delirium, and albuminuria. Following upon these symptoms, often after a lull and apparent beginning of recovery, may come exhaustion of the heart and nervous centers, bleeding from mucous membranes (giving rise to black vomit), jaundice, scanty urine, and albuminuria. The mortality in the better class of private cases varies in the experience of different observers from 7 to 10 per cent. The autopsy reveals, in addition to the hemorrhages, congestion of the nervous centers, hypostatic congestion of the lungs, fatty degeneration of the heart and liver, and parenchymatous nephritis. The infectious principle of the disease has been identified with various micro-organisms, and is probably a ptomaine-producing bacillus. It infects localities. In its spread from place to place human intercourse seems to be the efficient factor. It may be carried in clothes and other goods. Its development is favored by filth and repressed by cold. Individuals are infected by being in an infected locality. Personal contact with the sick does not seem to greatly enhance the exposure. Disinfection of food and drink is unavailing as a preventive measure. Whites are more susceptible to the disease than blacks, new-comers than old inhabitants. A previous attack usually produces immunity. Geographically it occurs in the warmer parts of America (though it has been known as far north as Portland in Maine), and in some parts of the old world.—**Yellow remittent fever,** ardent continued fever. The human fibula is a slender straight bone, as long as and separate from the tibia, and clubbed at both ends; the upper end is articulated with the tuberosity of the tibia, and excluded from the knee-joint; the lower end is connected with the tibia, and also articulated with the astragalus, thus entering into the ankle-joint, and forming the outer malleolus, or bony protuberance on the outer side of the ankle.
